## The Flight Framework

# To Set a Cookie

- ▶ Cookies are **set** with the **setcookie** function. Since cookies are sent as HTTP headers, this function must be called **before any output** is generated.

```
setcookie (string $name, string $value,  
          int $expire = 0, string $path,  
          string $domain, bool $secure = false,  
          bool $httponly = false)
```

- ▶ **name** and **value** is the cookie's **name/value pair**.
- ▶ **expire** tells the **instant in time** when the cookie expires. **time()** returns the current time, so **time() + 60 \* 60 \* 24 \* 30** sets the cookie to expire in 30 days.

# The EU Cookie Law

A person shall **not store or gain access to information stored, in the terminal equipment of a subscriber or user** unless the requirements of paragraph (2) are met.

(2) The requirements are that the subscriber or user of that terminal equipment

1. is provided with clear and comprehensive information about the purposes of the storage of, or access to, that information; and
2. has given his or her consent.

[Server-Side Tasks](#)[Cookies](#)[HTTP Sessions](#)[HTTP Parameters](#)[Application Scope and File Handling](#)[AJAX](#)[Server-Side Architecture](#)[The Flight Framework](#)

# Exceptions To The Law

- ▶ The cookie is for the sole purpose of carrying out the transmission of a communication over an electronic communications network.

## Server-Side Architecture

## The Flight Framework

# PHP Frameworks

- ▶ There are **many PHP frameworks**, of different size and quality.
- ▶ Some interesting and often used frameworks are Zend, Symfony, Yii, Laravel and Phalcon.
- ▶ Here, we will have a look at the **Flight** framework.

# Routing

- ▶ With Flight, [all](#) requests, independent of URL, shall be directed to **index.php**.
- ▶ **index.php** contains a set of routes from URLs to functions.

```
\Flight::route('/', function() {  
    // Action to be taken for the URL /  
});
```

# HTTP Parameters

- ▶ Routes can include parameters, a path element prefixed with @ is a parameter.
- ▶ Here, the parameters **author** and **message** are passed to the request handling method.

```
\Flight::route('/new-msg/@author/@message',  
              function($author, $message) {  
    // Action to be taken for  
    // the URL /new-msg  
});
```

# Composite Views

- ▶ Flight provides a basic mechanism for composite views. It is possible to define a HTML layout page, into which the page fragments are inserted.

```
<body>
  <header class="section group">
    <?php echo $header_content; ?>
  </header>
  <main class="section group">
    <nav class="section group">
      <?php echo $nav_content; ?>
    </nav>
    <?php echo $body_content; ?>
    <footer class="section group">
      <?php echo $footer_content; ?>
    </footer>
  </main>
</body>
```

# Composite Views

- ▶ The **fragments** must be defined.

```
\Flight::render($path_to_header_fragment, NULL,  
               'header_content');  
// More fragment definitions
```

# Composite Views

- ▶ The **fragments** must be defined.

```
\Flight::render($path_to_header_fragment, NULL,  
                'header_content');  
// More fragment definitions
```

- ▶ An **object** can be passed to a fragment.

```
\Flight::render($view, array($model_name => $model),  
                'body_content');
```
