Namespaces

DUDDee

- Namespaces are used to structure the program, as packages are used in Java.
- ► A namespace does not affect visibility, there is no package private visibility.
- Namespaces define name spaces, the same symbol (e.g., class) can exist in different namespaces.

Exception Handling

- Namespaces are used to structure the program, as packages are used in Java.
- A namespace does not affect visibility, there is no package private visibility.
- Namespaces define name spaces, the same symbol (e.g., class) can exist in different namespaces.
- Namespaces also structure the program and thereby improve cohesion.
  - If, for example, the MVC architecture is used, there should be the namespaces Model,
     View and Controller.

## **Declaring Namespaces**

Namespaces are declared with the **namespace** keyword, placed first in a file.

```
namespace \Model;
```

```
namespace \MyProject\Model\Payment;
```

## The Global Namespace

- In a file without any namespace definition, all classes and functions are placed in the global namespace.
- Prefixing a name with \ will specify that the name is required from the global namespace.
- ► It is good practice to prefix all functions in the global space with \, even though the interpreter always looks for functions in the global space before failing.
