PROBLEM 1

A dipole is formed by two point sources with charge $+c$ and $-c$
 Calculate the flux of the dipole field on a closed surface S that

- (a) encloses both poles
- (b) encloses only the plus pole
- (c) does not enclose any pole

SOLUTION

Vector field from
a point source
located in \bar{r}_0 :

$$\bar{A}(\bar{r}) = c \frac{\bar{r} - \bar{r}_0}{|\bar{r} - \bar{r}_0|^3}$$

Vector field from
two point sources
located in \bar{r}_1 and \bar{r}_2

$$\bar{A}(\bar{r}) = c \frac{\bar{r} - \bar{r}_1}{|\bar{r} - \bar{r}_1|^3} - c \frac{\bar{r} - \bar{r}_2}{|\bar{r} - \bar{r}_2|^3}$$

Flux from
a point source:

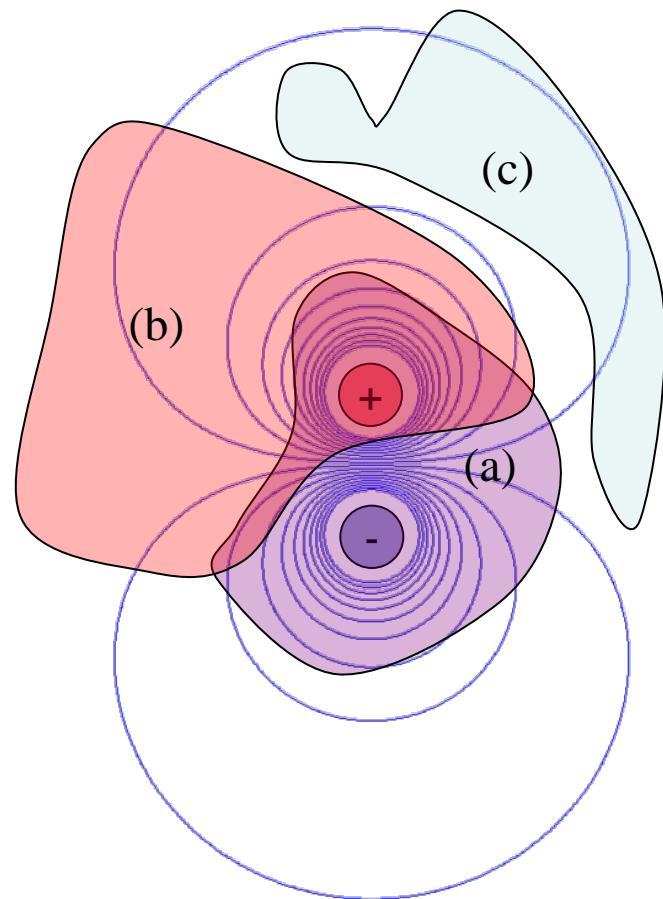

$$= \begin{cases} 0 & \text{If the origin is outside } V \\ 4\pi c & \text{If the origin is inside } V \end{cases}$$

$$\oint_S \left(c \frac{\bar{r} - \bar{r}_1}{|\bar{r} - \bar{r}_1|^3} - c \frac{\bar{r} - \bar{r}_2}{|\bar{r} - \bar{r}_2|^3} \right) \cdot d\bar{S} = \oint_S c \frac{\bar{r} - \bar{r}_1}{|\bar{r} - \bar{r}_1|^3} \cdot d\bar{S} - \oint_S c \frac{\bar{r} - \bar{r}_2}{|\bar{r} - \bar{r}_2|^3} \cdot d\bar{S}$$

$$(a) \quad \oint_S (\) \cdot d\bar{S} = \quad 4\pi c \quad -4\pi c \quad = 0$$

$$(b) \quad \oint_S (\) \cdot d\bar{S} = \quad 4\pi c \quad 0 \quad = 4\pi c$$

$$(c) \quad \oint_S (\) \cdot d\bar{S} = \quad 0 \quad 0 \quad = 0$$

PROBLEM 2

Use the Gauss theorem to calculate the flux of the vector field: $\bar{A}(\rho, \varphi, z) = z \frac{\rho^2 - 1}{\rho} \hat{e}_\rho$

on the surface S : $x^2 + y^2 + (z - 2)^2 \leq 4$

SOLUTION

The field is singular at $\rho=0$ (the z -axis)

The Gauss theorem cannot be applied on S .

We divide V into 2 volumes:

$$V = V_0 + V_\varepsilon$$

Thin cylinder with radius ε along the z -axis

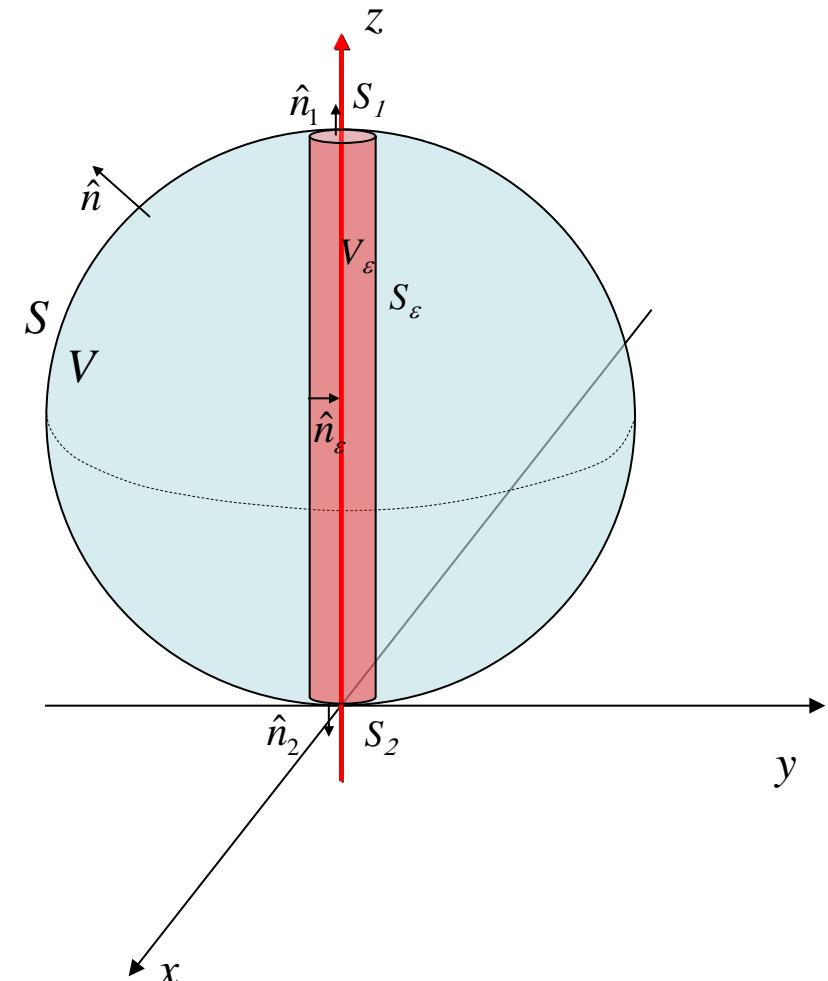

The boundary surface to V_0 is: $S + S_\varepsilon - S_1 - S_2$

Does not contain the z -axis
 ⇒ here we can apply Gauss!

$$\iint_S \bar{A}(\bar{r}) \cdot d\bar{S} = \iint_{S+S_\varepsilon-S_\varepsilon+S_1} \bar{A}(\bar{r}) \cdot d\bar{S} =$$

$$= \iint_{-S_1+S_2-S_2} \bar{A}(\bar{r}) \cdot d\bar{S}$$

$$= \iint_{S+S_\varepsilon-S_1-S_2} \bar{A}(\bar{r}) \cdot d\bar{S} + \iint_{-S_\varepsilon+S_1+S_2} \bar{A}(\bar{r}) \cdot d\bar{S} = \iiint_{V_0} \operatorname{div} \bar{A} dV + \iint_{-S_\varepsilon+S_1+S_2} \bar{A}(\bar{r}) \cdot d\bar{S}$$

$$\begin{aligned}
&= \iiint_{V_0} \operatorname{div} \bar{A} dV + \iint_{-S_\varepsilon + S_1 + S_2} \bar{A}(\bar{r}) \cdot d\bar{S} = \iiint_{V_0} \operatorname{div} \bar{A} dV - \iint_{S_\varepsilon} \bar{A}(\bar{r}) \cdot d\bar{S} + \iint_{S_1} \bar{A}(\bar{r}) \cdot d\bar{S} + \iint_{S_2} \bar{A}(\bar{r}) \cdot d\bar{S} \\
&\quad I \qquad \qquad \qquad II \qquad \qquad \qquad III \qquad \qquad \qquad IV
\end{aligned}$$

Integrals *III* and *IV* are zero:

$$\iint_{S_1} \bar{A}(\bar{r}) \cdot d\bar{S} = \iint_{S_1} z \frac{\rho^2 - 1}{\rho} \hat{e}_\rho \cdot \hat{e}_z dS = \boxed{0}$$

$$\lim_{\varepsilon \rightarrow 0} d\bar{S} = \hat{e}_z dS$$

$$\iint_{S_2} \bar{A}(\bar{r}) \cdot d\bar{S} = - \iint_{S_2} z \frac{\rho^2 - 1}{\rho} \hat{e}_\rho \cdot \hat{e}_z dS = \boxed{0}$$

$$\lim_{\varepsilon \rightarrow 0} d\bar{S} = -\hat{e}_z dS$$

Integrals *II* is:

$$\begin{aligned}
&- \iint_{S_\varepsilon} \bar{A}(\bar{r}) \cdot d\bar{S} = - \iint_{S_\varepsilon} z \frac{\rho^2 - 1}{\rho} \hat{e}_\rho \cdot (-\hat{e}_\rho) dS = \iint_{S_\varepsilon} z \frac{\rho^2 - 1}{\rho} dS \stackrel{dS = \varepsilon d\varphi dz}{=} \iint_{S_\varepsilon} z \frac{\varepsilon^2 - 1}{\varepsilon} \varepsilon d\varphi dz = \\
&= \int_0^{2\pi} \int_{2-\sqrt{4-\varepsilon^2}}^{2+\sqrt{4-\varepsilon^2}} z (\varepsilon^2 - 1) d\varphi dz = 2\pi (\varepsilon^2 - 1) \int_{2-\sqrt{4-\varepsilon^2}}^{2+\sqrt{4-\varepsilon^2}} zdz = 8\pi (\varepsilon^2 - 1) \sqrt{4 - \varepsilon^2}
\end{aligned}$$

But the cylinder is very “*thin*”, which means that we need: $\lim_{\varepsilon \rightarrow 0}$

$$\lim_{\varepsilon \rightarrow 0} 8\pi(\varepsilon^2 - 1)\sqrt{4 - \varepsilon^2} = \boxed{-16\pi}$$

Integrals I is:

$$\iiint_{V_0} \operatorname{div} \bar{A} dV = \iiint_{V_0} \operatorname{div} \left(z \frac{\rho^2 - 1}{\rho} \hat{e}_\rho \right) dV = \iiint_{V_0} \frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho z \frac{\rho^2 - 1}{\rho} \right) dV = \iiint_{V_0} 2z dV$$

The volume is a sphere with centre in the point (0,0,2)

Therefore, to use spherical coord. a coordinate transformation is necessary: $z' = z - 2$

$$\begin{aligned} \iiint_{V_0} 2z dV &= \iiint_{V_0} 2(z' + 2) dV = \iiint_{V_0} 4 dV + \iiint_{V_0} 2z' dV = 4 \frac{4\pi 2^3}{3} + \iiint_{V_0} 2r \cos \theta r^2 \sin \theta dr d\theta d\varphi \\ &= \frac{128\pi}{3} + 2 \left[\frac{r^4}{4} \right]_0^2 2\pi \underbrace{\left[-\frac{\cos^2 \theta}{2} \right]_0^\pi}_{0} = \boxed{\frac{128\pi}{3}} \end{aligned}$$

$$I + II + III + IV = \frac{128\pi}{3} - 16\pi + 0 + 0 = -\frac{80\pi}{3}$$

LAPLACE OPERATOR IN CURVILINEAR COORDINATES

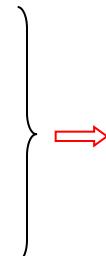

The Laplace equation is $\nabla^2 \phi = 0$

The Laplace operator ∇^2 is the divergence of the gradient:

$$\nabla^2 \phi \equiv \nabla \cdot \nabla \phi$$

CARTESIAN COORDINATES

- GRADIENT $\nabla \phi = \left(\frac{\partial \phi}{\partial x}, \frac{\partial \phi}{\partial y}, \frac{\partial \phi}{\partial z} \right)$
- DIVERGENCE $\nabla \cdot \vec{A} = \frac{\partial A_z}{\partial x} + \frac{\partial A_y}{\partial y} + \frac{\partial A_z}{\partial z}$

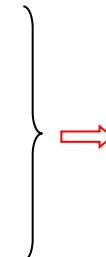

CARTESIAN

$$\nabla^2 \phi = \left(\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 \phi}{\partial z^2} \right)$$

CYLINDRICAL COORDINATES

- GRADIENT $\nabla \phi = \left(\frac{\partial \phi}{\partial \rho}, \frac{1}{\rho} \frac{\partial \phi}{\partial \varphi}, \frac{\partial \phi}{\partial z} \right)$
- DIVERGENCE $\nabla \cdot \vec{A} = \left(\frac{1}{\rho} \frac{\partial (\rho A_\rho)}{\partial \rho} + \frac{1}{\rho} \frac{\partial A_\varphi}{\partial \varphi} + \frac{\partial A_z}{\partial z} \right)$

CYLINDRICAL

$$\nabla^2 \phi = \frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) + \frac{1}{\rho^2} \frac{\partial^2 \phi}{\partial \varphi^2} + \frac{\partial^2 \phi}{\partial z^2}$$

SPHERICAL COORDINATES

- GRADIENT $\nabla \phi = \left(\frac{\partial \phi}{\partial r}, \frac{1}{r} \frac{\partial \phi}{\partial \theta}, \frac{1}{r \sin \theta} \frac{\partial \phi}{\partial \varphi} \right)$
- DIVERGENCE $\nabla \cdot \vec{A} = \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 A_r) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \theta} (\sin \theta A_\theta) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \varphi} (A_\varphi)$

SPHERICAL

$$\nabla^2 \phi = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial \phi}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial \phi}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 \phi}{\partial \varphi^2}$$

PROBLEM 3

An infinitely long cylinder with radius R has a charge density ρ_c . Calculate the potential and the electric field:

- (a) Inside the cylinder
- (b) Outside the cylinder

Assume the potential on the surface is V_0 .

SOLUTION

Due to the symmetry of the problem,
the solution will depend on the radius only: $\phi = \phi(\rho)$

Inside the cylinder

$$\nabla^2 \phi = -\frac{\rho_c}{\epsilon_0}$$

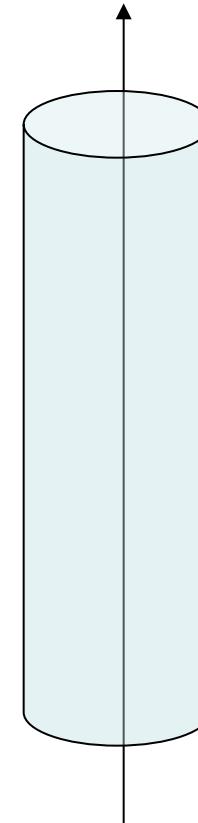

cylindrical coord.

$$\nabla^2 \phi = \frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) + \underbrace{\frac{1}{\rho^2} \frac{\partial^2 \phi}{\partial \varphi^2}}_{=0} + \underbrace{\frac{\partial^2 \phi}{\partial z^2}}_{=0} = -\frac{\rho_c}{\epsilon_0}$$

Because the solution depends only on ρ

The equation becomes:

$$\frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) = -\frac{\rho_c}{\epsilon_0}$$

$$\frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) = -\frac{\rho_c}{\epsilon_0} \Rightarrow \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) = -\frac{\rho_c}{\epsilon_0} \rho \Rightarrow \rho \frac{\partial \phi}{\partial \rho} = -\frac{\rho_c}{2\epsilon_0} \rho^2 + a \Rightarrow \frac{\partial \phi}{\partial \rho} = -\frac{\rho_c}{2\epsilon_0} \rho + \frac{a}{\rho} \Rightarrow$$

$$\left[\begin{array}{l} \bar{E} = -\nabla \phi = -\left(\frac{d\phi(\rho)}{d\rho}, \underbrace{\rho \frac{d\phi(\rho)}{d\varphi}}_{=0}, \underbrace{\frac{d\phi(\rho)}{dz}}_{=0} \right) \Rightarrow E_r = -\frac{d\phi(\rho)}{d\rho} = +\frac{\rho_c}{2\epsilon_0} \rho - \frac{a}{\rho} \\ \text{Because the solution depends only on } \rho \\ \text{Divergent at } \rho=0 \text{ NOT physical! } \Rightarrow a=0 \end{array} \right]$$

$$\frac{\partial \phi}{\partial \rho} = -\frac{\rho_c}{2\epsilon_0} \rho \Rightarrow \boxed{\phi(\rho) = -\frac{\rho_c}{4\epsilon_0} \rho^2 + b}$$

Integrating in ρ

Outside the cylinder

$$\nabla^2 \phi = 0 \quad \leftarrow \text{There is no charge}$$

And the equation becomes:

$$\frac{1}{\rho} \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) = 0 \Rightarrow \frac{\partial}{\partial \rho} \left(\rho \frac{\partial \phi}{\partial \rho} \right) = 0 \Rightarrow \rho \frac{\partial \phi}{\partial \rho} = c \Rightarrow \frac{\partial \phi}{\partial \rho} = \frac{c}{\rho} \Rightarrow \boxed{\phi(\rho) = c \ln \rho + d}$$

Multiplying by ρ *Integrating in ρ* *Dividing by ρ* *Integrating in ρ*

$$E_r = -\frac{d\phi(\rho)}{d\rho} = \boxed{-\frac{c}{\rho}}$$

$$E_r^{in}(\rho) = +\frac{\rho_c}{2\epsilon_0}\rho \quad \phi^{in}(\rho) = -\frac{\rho_c}{4\epsilon_0}\rho^2 + b$$

$$E_r^{out} = -\frac{c}{\rho} \quad \phi^{out}(\rho) = c \ln \rho + d$$

Now we must determine the three constants b , c and d .

We have three conditions:

- (1) Continuity of the electric field at $\rho=R$
- (2) The potential at $\rho=R$
- (3) Continuity of the potential at $\rho=R$

$$(1) \quad E_r^{in}(R) = E_r^{out}(R) \Rightarrow +\frac{\rho_c}{2\epsilon_0}R = -\frac{c}{R} \Rightarrow c = -\frac{\rho_c}{2\epsilon_0}R^2 \Rightarrow \phi^{out}(\rho) = -\frac{\rho_c}{2\epsilon_0}R^2 \ln \rho + d$$

$$(2) \quad \phi^{out}(R) = V_0 \Rightarrow -\frac{\rho_c}{2\epsilon_0}R^2 \ln R + d = V_0 \Rightarrow d = V_0 + \frac{\rho_c}{2\epsilon_0}R^2 \ln R$$

$$\Rightarrow \phi^{out}(\rho) = -\frac{\rho_c}{2\epsilon_0}R^2 \ln \rho + d = -\frac{\rho_c}{2\epsilon_0}R^2 \ln \rho + V_0 + \frac{\rho_c}{2\epsilon_0}R^2 \ln R = V_0 - \frac{\rho_c}{2\epsilon_0}R^2 \ln \left(\frac{\rho}{R} \right)$$

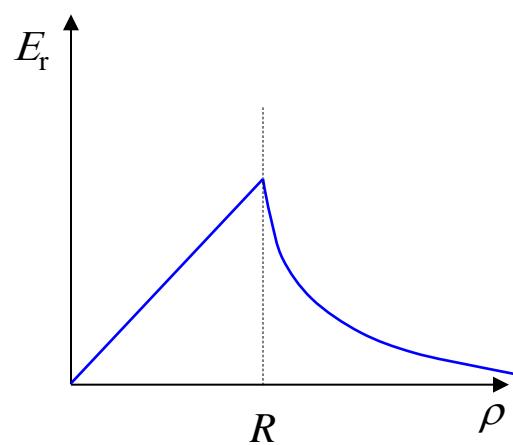

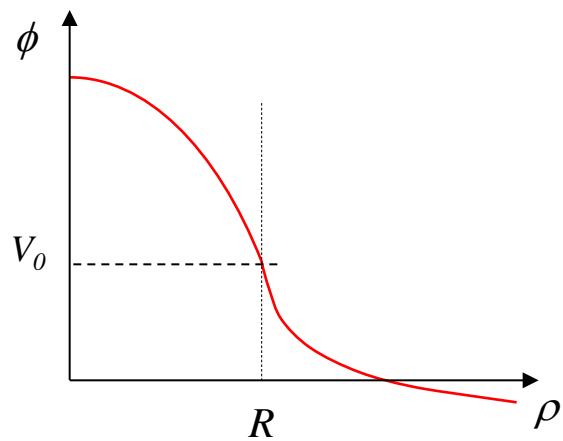

$$(3) \quad \phi^{out}(R) = \phi^{in}(R) \Rightarrow V_0 - \underbrace{\frac{\rho_c}{2\epsilon_0}R^2 \ln \left(\frac{R}{R} \right)}_{=0} = -\frac{\rho_c}{4\epsilon_0}R^2 + b \Rightarrow b = V_0 + \frac{\rho_c}{4\epsilon_0}R^2$$

$$\phi^{in}(\rho) = V_0 + \frac{\rho_c}{4\epsilon_0} R^2 \left(1 - \frac{\rho^2}{R^2} \right)$$

$$E_r^{in}(\rho) = + \frac{\rho_c}{2\epsilon_0} \rho$$

$$\phi^{out}(\rho) = V_0 - \frac{\rho_c}{2\epsilon_0} R^2 \ln\left(\frac{\rho}{R}\right)$$

$$E_r^{out} = \frac{\rho_c}{2\epsilon_0} \frac{R^2}{\rho}$$

Note that: $\lim_{\rho \rightarrow \infty} \phi(\rho) = -\infty$

This solution is unphysical.
How is this possible?
