

Assignment 5 – Epson Moverio

Using the Moverio to make a platform sidescroller game similar to the old Super Mario games, but in 3D. Having a table in front of you would make the basis for the game world. Obstacles, enemies, clouds, grass and of course your character would then be added to that surface and together creating the game world.

So the users would probably be people wanting to pass their time whether it being at home or a flight (where the tray would be the basis for the game world). Or anyone who just wants to play a sidescroller game using AR for the fun of it. If connecting two Moverios is possible, then you could them for multiplayer, maybe racing each other through the levels. I don't know if this would even be possible but if it is, using the stuff on your table as obstacles would be amazing. So that you either alone or together with someone that's connected to you build the world of the game and then play through it, and thus making the game both about building and then clearing that level.
