

Sport event replays

Alright, so when I'm at football games I sometimes have the problem that I miss a goal or other important incident for some reason, being the fact that I'm shorter than the guy in front of me or I'm at a beer run. The replays on the jumbotron are usually only displayed once, and are therefore also easy to miss. My idea involves the Moverio at sporting events for instant replays of important events, like goals and such. You could get a replay augmented on the field from the official tv broadcasts and translated such that it fits the view from where you're standing or sitting. During the final group stages it would also be nice to get updates from the other games that is going on simultaneously. Another possibility would be to get a first person view from the player, similar to the Nike commercial: <https://www.youtube.com/watch?v=6kUNQlbdKwY>. But that obviously has the complication that each player would need a camera (or Epson Moverios?!) on his/her head.
