Written exam with solutions for
IE1204/5 Digital Design
Thursday 15/1 2015 9.00-13.00

General Information
Examiner: Ingo Sander.
Teacher: Kista, William Sandqvist, tel 08-790 44 87.
KTH Valhallavägen, Fredrik Jonsson, tel 08-790 41 69.

Exam text does not have to be returned when you hand in your writing.

Aids: No aids are allowed!

The exam consists of three parts with a total of 12 tasks, and a total of 30 points:

Part A1 (Analysis) contains eight short questions. Right answer will for six of the questions give you one point and for two of the questions one or two points. Incorrect answer will give you zero points. The total number of points in Part A1 is 10 points. To pass the Part A1 requires at least 6p, if fewer points we will not look at the rest of your exam.

Part A2 (Methods) contains two method problems on a total of 10 points.
To pass the exam requires at least 11 points from A1 + A2, if fewer points we will not look at the rest of your exam.

Part B (Design problems) contains two design problems of a total of 10 points. Part B is corrected only if there are at least 11p from the exam A- Part.

NOTE ! At the end of the exam text there is a submission sheet for Part A1, which can be separated to be submitted together with the solutions for A2 and B.

For a passing grade (E) requires at least 11 points on the exam.

Grades are given as follows:

<table>
<thead>
<tr>
<th>Points</th>
<th>Grade</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 11</td>
<td>F</td>
</tr>
<tr>
<td>12 – 16</td>
<td>E</td>
</tr>
<tr>
<td>17 – 19</td>
<td>D</td>
</tr>
<tr>
<td>20 – 22</td>
<td>C</td>
</tr>
<tr>
<td>23 – 25</td>
<td>B</td>
</tr>
<tr>
<td></td>
<td>A</td>
</tr>
</tbody>
</table>

The result is expected to be announced before Thursday 5/2 2015.
Part A1: Analysis

Only answers are needed in Part A1. Write the answers on the submission sheet for Part A1, which can be found at the end of the exam text.

1. 1p/0p
A function \( f(x, y, z) \) is described by the equation:
\[
f(x, y, z) = xy + yz + yz + xy
\]
Minimize the function.
\[
f(x, y, z)_{\text{min}} = ?
\]

### 1. Suggested solution

\[
f(x, y, z) = xy + yz + yz + xy
\]
\[
f(x, y, z)_{\text{min}} = z + x
\]

2. 2p/1p/0p
A four bit unsigned integer \( x(x_3x_2x_1x_0) \) is to be multiplied by the constant 3. \( y = 3 \cdot x \).
The number \( x \) is connected to a six bit adder which is configured for the operation \( 3 \cdot x = 4 \cdot x + -1 \cdot x \)

a) Suppose that the four bit number \( x = 12 \), which six bit number then represents \( -x \) (in two complement representation)? Answer with a binary number.

b) Draw how the adder is to be configured. Except the four bit in \( x \) there are also bits with the values 0 and 1 if needed. You will find a copy of the figure on the submission sheet.

### 2. Suggested solution

a) (1p)
\[
x = 12_{10} = 1100_2 = 001100_2
\]
\[
-x = 110011_2 + 1 = 110100_2
\]

b) (1p)
\[
y = y_5y_4y_3y_2y_1y_0 = 3 \cdot x = 4 \cdot x - 1 \cdot x
\]
3. 1p/0p
Given is a Karnaugh map for a function of four variables $y = f(a, b, c, d)$. Write the function as a minimized sum of products, SP form. "-" in the map means "don’t care".

\[
\begin{array}{cccc}
  & c & d & \text{00} & \text{01} & \text{11} & \text{10} \\
 a & 0 & 1 & 0 & 0 & 1 & \\
 b & 0 & 0 & 1 & 1 & 0 & 0 \\
 c & 1 & - & 1 & 1 & 0 & 0 \\
 d & 1 & 1 & 1 & 0 & 0 & - \\
\end{array}
\]

1. Suggested solution
\[
y = f(a, b, c)_{\text{min}} = b\overline{c} + \overline{b}d
\]

4. 1p/0p
Write the logic function that is realized by the circuit as a minimized sum of products, SP form.

\[y = f(a, b)\]

4. Suggested solution
\[
y = (a + b) \cdot a \cdot \overline{b} = \{dM\} = (a + b) \cdot (\overline{a} + \overline{b}) = \\
= a \cdot \overline{a} + a \cdot \overline{b} + b \cdot \overline{a} + b \cdot \overline{b} = a \cdot \overline{b} + b \cdot \overline{a} = \\
(= a \oplus b)
\]
5. 1p/0p
Give an expression for the logical function realized by the CMOS circuit in the figure?

\[ Y = A + \overline{B} = A + \overline{B} \]

5. Suggested solution

6. 1p/0p
Sequence network starts in the state \( q_1q_0 = 00 \). Analyze the circuit and give the sequence for the following four clockpulses.

6. Suggested solution

\[
\begin{array}{c|c|c|c|c|c}
q_1 & q_0 & q_1^+ & q_0^+ & q_1^+q_0^+ \\
00 & 01 & 01 & 10 & 00, 01, 10, 01 ...
\end{array}
\]

\[
q_1^+ = \overline{q}_1q_0 \quad q_0^+ = q_1 + \overline{q}_0
\]

01
01
01
10
7. 2p/1p/0p
The circuit below is suffering from the hazard-phenomen.

a) Write the logic function \( y = f(a,b,c) \) that is realized by the circuit.
b) Which **product term** is to be added to the logical function \( y \) to prevent the hazard?

![Circuit Diagram]

7. Suggested solution (1p+1p)

\[ a) \quad y = ba + \overline{bc} \]
\[ b) \quad ac \quad \Rightarrow \quad y = ba + \overline{bc} + ac \]

8. 1p/0p
The entity part of a VHDL-code describes the chip 7440x. (which is equivalent to the chip 7440, but with other names of the inputs and outputs). Unfortunately, some of the numbering of the logic vectors has become unreadable - correct this. (Correct the red question marks. The VHDL lines are also on the answer sheet).

![VHDL Code]

8. Suggested solution

```vhdl
ENTITY chip7440 IS
PORT ( a, b : IN STD_LOGIC_VECTOR( 3 downto 0 ); y : OUT STD_LOGIC_VECTOR( 1 downto 0 ); END chip7440x ;
```
Part A2: Methods

Note! Part A2 will only be corrected if you have passed part A1 (≥6p).

9. 5p

Displays for blind persons are using Braille cells with digitally controllable points (points feels like elevated to the finger when they are driven by logical 1).

You will design a combinatorial network which translates from the bit vector \( x \) in BCD code (the digits 0 to 9 binary coded), to the bit vector \( y \) in Braille alphabet numbers, see the table below.

Note that we restrict ourselves to only the digits 0 ... 9, no letters or other characters appear.

<table>
<thead>
<tr>
<th>BCD → Braille</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x_3x_2x_1x_0 )</td>
</tr>
</tbody>
</table>

The Braille Cell

\[
\begin{array}{cccccc}
1 & 4 & 2 & 5 & 3 & 6 \\
\end{array}
\]

\[
\begin{array}{cccccccccccc}
a/1 & b/2 & c/3 & d/4 & e/5 & f/6 & g/7 & h/8 & i/9 & j/0 \\
\end{array}
\]

\[
\begin{array}{ccccccccc}
k & l & m & n & o & p & q & r & s & t \\
\end{array}
\]

\[
\begin{array}{cccc}
u & v & x & y & z \\
w \\
\end{array}
\]

a) (1p) Derive the truth table for \( y_6y_5y_4y_3y_2y_1 = f(x_3x_2x_1x_0) \).

b) (1p) Develop the minimized expressions for \( y_6 \ y_5 \ y_4 \ y_3 \ y_2 \ y_1 \) (exploit don’t care ).

c) (1p) Realize the function \( y_1 \) with optional gates.. Draw the schematic.

d) (1p) Realize the function \( y_2 \) with only two and three - input NAND gates. Draw the schematic.

e) (1p) Realize the function \( y_5 \) with a 4: 1 MUX (can be solved without using any gates). Draw the schematic.
9. Suggested solution

a) (1p)

\[
\begin{array}{c|cccccccc}
& y_1 & y_2 & y_3 & y_4 & y_5 \\
\hline
y_0 & 0 & 0 & 0 & 0 & 0 \\
y_1 & 0 & 0 & 0 & 0 & 1 \\
y_2 & 0 & 0 & 1 & 1 & 0 \\
y_3 & 0 & 0 & 1 & 0 & 1 \\
y_4 & 0 & 0 & 1 & 1 & 1 \\
y_5 & 0 & 1 & 0 & 1 & 0 \\
y_6 & 0 & 1 & 0 & 1 & 1 \\
y_7 & 0 & 1 & 1 & 0 & 1 \\
y_8 & 0 & 1 & 1 & 1 & 0 \\
y_9 & 0 & 1 & 1 & 1 & 1 \\
\end{array}
\]

\[y_1 = x_1 + x_2 + x_3 x_0 + x_4 x_0 = x_1 + x_2 + x_3 \oplus x_0\]

\[y_2 = x_3 + x_2 x_1 + x_2 \bar{x}_0\]

\[y_4 = x_1 x_0 + x_2 x_1 + x_3 x_0 + x_3 x_1 x_0\]

\[y_5 = x_1 x_0 + x_2 x_0\]

c) (1p)

\[y_1 = x_1 + x_2 + x_3 \oplus x_0\]

\[x_1 \quad x_2 \quad x_3 \quad x_0 \quad \geq \quad y_1\]

d) (1p)

\[y_2 = x_3 + x_2 x_1 + x_2 \bar{x}_0 = x_3 + x_2 x_1 + x_2 x_0 = x_3 \cdot x_1 \cdot x_2 \cdot x_2 \cdot x_0\]

\[y_2 = x_3 \cdot x_1 \cdot x_2 \cdot x_2 \cdot x_0\]

d) (1p)

\[y_5 = \overline{x_1 x_0 + x_2 x_0}\]

\[y_5 = x_1 x_0 + x_2 x_0\]

\[x_2 \quad x_0 \quad 11 \quad 01 \quad 00 \quad y_5\]

\[x_2 \quad x_0 \quad s_1 \quad s_0 \quad y_5\]
10. 5p. Analyze the following synchronous "shift register counter" with T-flip-flops.

a) (2p) Draw the counter state diagram (all 8 states). Derive the counter’s coded state table.

b) (2p) Now implement the counter with D flip-flops instead of T flip-flops. Use your state table in a).

Derive the minimized expressions for the three D flip-flops next state decoder. $q_2^*$, $q_1^*$, $q_0^*$ marked with "?" in the figure.

c) (1p) Draw the schematic for $q_2^*$, $q_1^*$, $q_0^*$ you may use optional gates.

(Inverted variables are available from the flip-flops)

10. Suggested solution a) (2p)

b) (2p)

c) (1p)
Part B. Design Problems

Note! Part B will only be corrected if you have passed part A1+A2 (≥11p).

11. 6p. Sequence Detector.

Obtain a minimal state table (show that it is minimal) for a synchronous sequential circuit of Moore-type with an input signal \((w)\), and an output signal \((z)\). The sequence net will generate the output 1 if it detects either input sequence 110 or 101, also overlapping sequences are valid (eg. 1101, is 110 followed by 101, will give output 00011). Derive the state diagram.

b) (2p) Use Gray code to encode the states and set up the encoded state table. Obtain the minimized expressions for the next state and output value. No schematic of the circuit is needed to be drawn.

11. Suggested solution  a) (4p)

### Minimal number of states

\[
A \to (ABCE)(DF) \quad A_0 \to (ABCE) \quad A_1 \to (ABCE) \\
B_0 \to (ABC E) \quad B_1 \to (ABC E) \\
C_0 \to (DF) \quad C_1 \to (ABCE) \\
E_0 \to (ABCE) \quad E_1 \to (DF) \\
\]

### State Diagram

\[
present \quad next \quad out
\]

\[
\begin{array}{cccc}
A & B & C & D \\
0 & 0 & 0 & 0 \\
0 & 1 & 1 & 1 \\
1 & 0 & 0 & 0 \\
1 & 1 & 1 & 1 \\
\end{array}
\]

### State Table

\[
\begin{array}{cccccc}
q_0 & q_1 & q_0 & q_1 & q_0 & q_1 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 1 & 1 & 1 & 1 \\
1 & 0 & 0 & 0 & 0 & 0 \\
1 & 1 & 1 & 1 & 1 & 1 \\
\end{array}
\]

### Next State and Output Expressions

\[
q_2^* = f(q_2, q_1, q_0, w) \\
q_3^* = f(q_2, q_1, q_0, w) \\
q_4^* = f(q_2, q_1, q_0, w) \\
q_0^* = w
\]

### Kmap Form
12. 4p Positive edge trigger.

Construct an asynchronous sequential circuit which at the change (0→1) of the input signal \( w \) generates a short pulse at the output \( z \). For other input events the output should be \( z = 0 \). Output pulse length is given by the time for the transition state in the asynchronous sequential circuit. See timing diagram for clarification.

Your answer must include a state diagram, if necessary minimized, a flow table, and an appropriate state assignment with a excitation table that gives race-free net. You must also develop the hazard-free expressions for the next state and an expression for the output, and draw the gate circuit. It’s free to use any type of gates.

12. 4p. Suggested solution

The unstable transition state \( b \) with output 1 generates the output pulse. It is followed by another transition state \( c \) with the output 0. The states can be coded with the Gray Code 00 01 11 10 (state diagram becomes corners of a cube).

The groupings int he Karnaugh map is direct hazard-free.

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c|c|c}
\text{state} & \text{next} & \text{out} & \text{state} & \text{next} & \text{out} & \text{state} & \text{next} & \text{out} \\
0 & w & z & 0 & w & z & 0 & w & z \\
a & b & 0 & 00 & 0 & 0 & 0 & 0 & 0 \\
b & c & 1 & 01 & 1 & 1 & 1 & 0 & 1 \\
c & d & 0 & 11 & 0 & 10 & 0 & 11 & 0 \\
d & a & 0 & 10 & 0 & 10 & 0 & 10 & 0 \\
\end{array}
\]

\[
z = q_1q_0 \\
q_1^* = q_0 + wq_1 \\
q_0^* = wz_1 + q_1q_0
\]

\[
z = \overline{q}_1q_0 \\
q_1^* = q_0 + wq_1 \\
q_0^* = wz_1 + q_1q_0
\]

\[
q_1^* = q_0 + wq_1 \\
q_0^* = wz_1 + q_1q_0
\]

Good Luck!
