

# Digital oscilloscope

# Blockdiagram ( one channel )

# Menu-Buttons and Entry-knob

## Entry - knob

You could reach the different menus from the Buttons. Under the screen you will find Softkeys. You make your selections by twisting and pressing the Entry-knob.

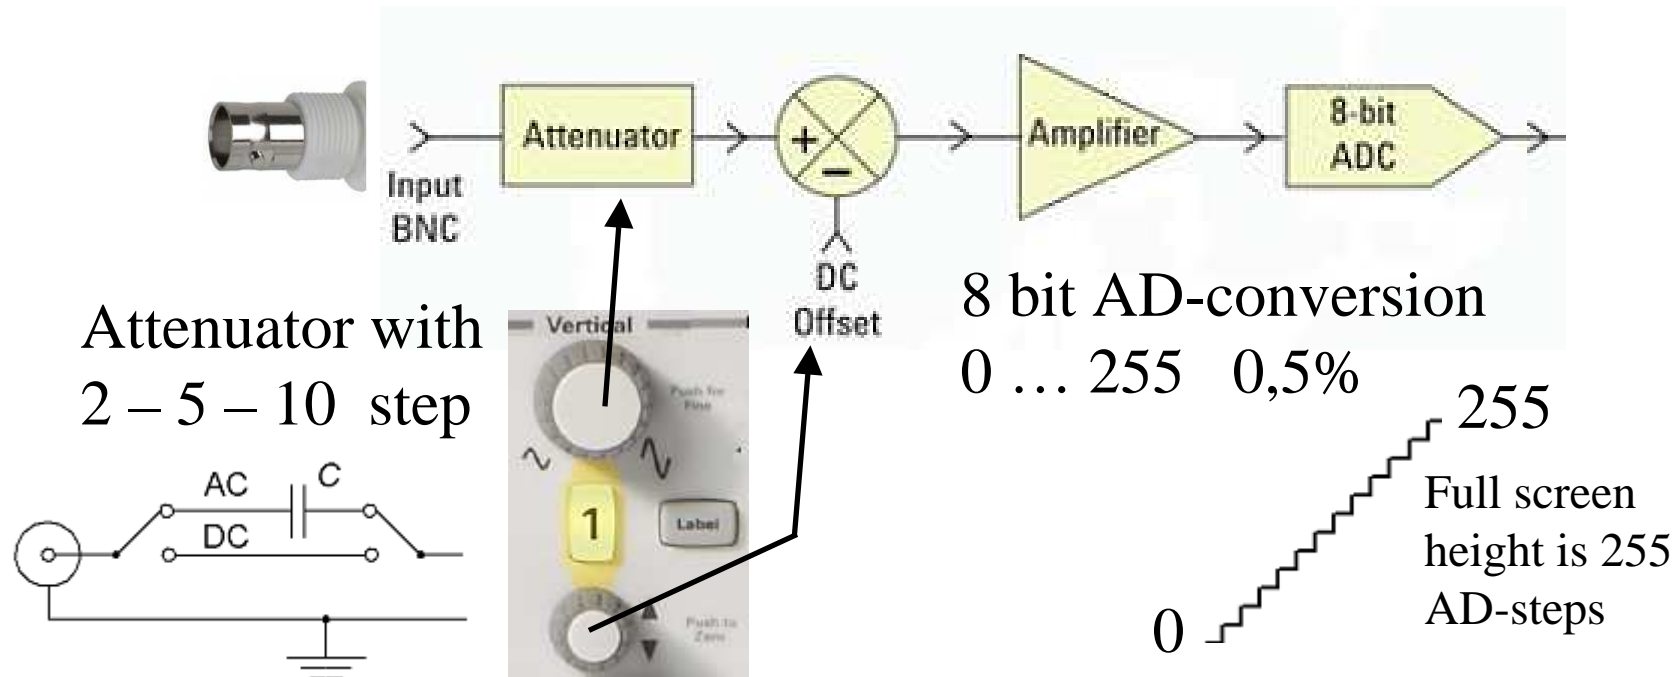

### Softkey Labels

*If you press any button "for a second" – then the appropriate helptext will be displayed!*

← **Softkeys**

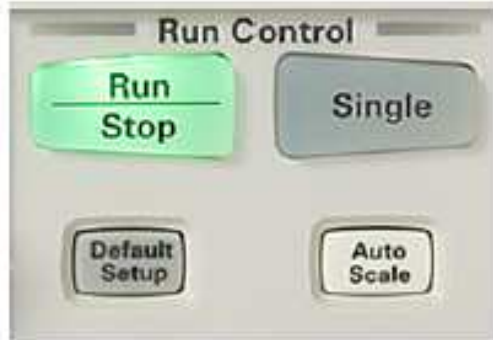

# Vertical (Y-axis, voltage)

Input could be AC-coupled in order to block DC-components. **DC-coupled is the default setting.**

If you could find an attenuator-setting for your signal to fill the entire screen height, then your measurement will have the resolution of 0,5%.

# Run Control

- **Run/Stop.** The data storage will update repeatedly (most common). If the signal is periodic and has a well defined trigger-point then the display will show a stable trace.
- **Stop** will "freeze" the trace as it was at the instance when you pressed the stop-button.
- **Single.** Data is stored in the buffer **once**. When the acquisition memory is full, the display will show the trace. This setting is for single events.

*Despite settings, a digital oscilloscope will always present a recorded version of your signal.*

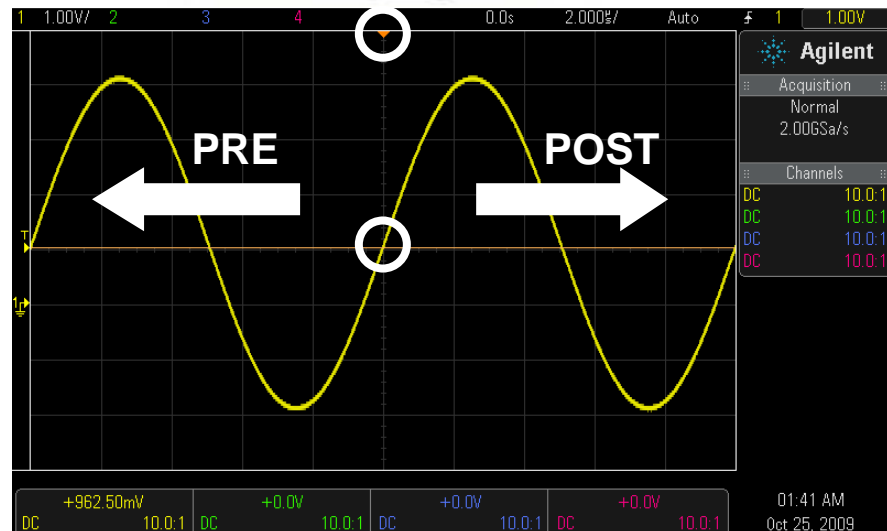

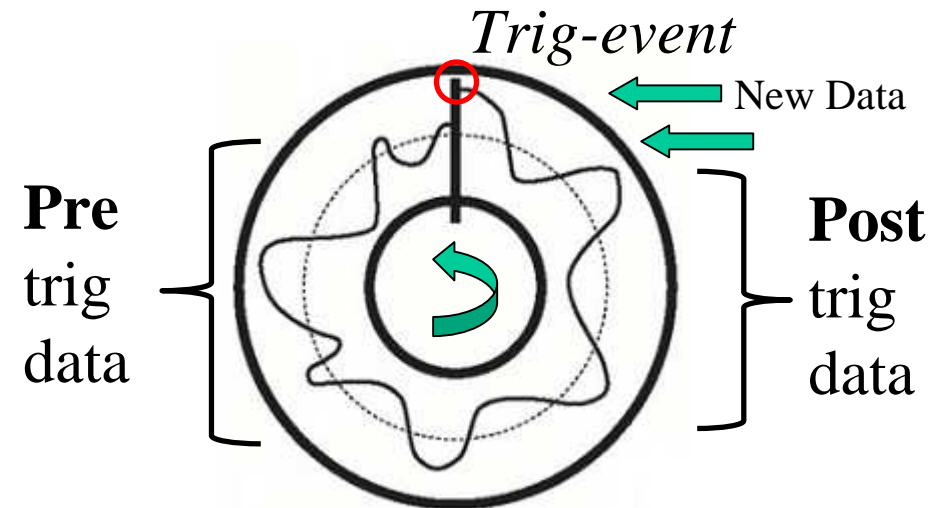

# Acquisition buffer

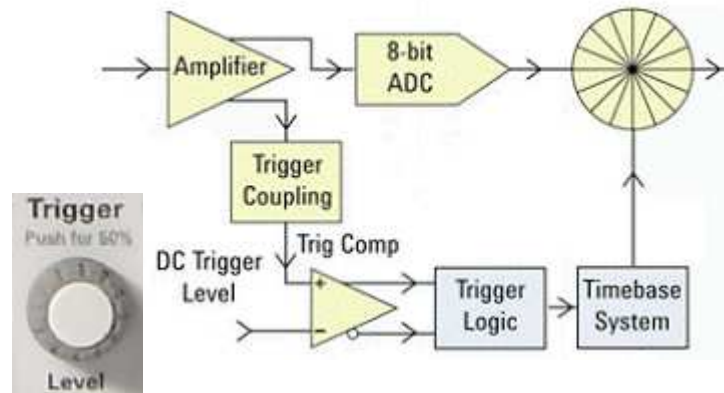

Data is continuously stored in a circular buffer.

When the trig-event is fulfilled the buffer is defined as "half full" and the new data is stored in the other half of the buffer.

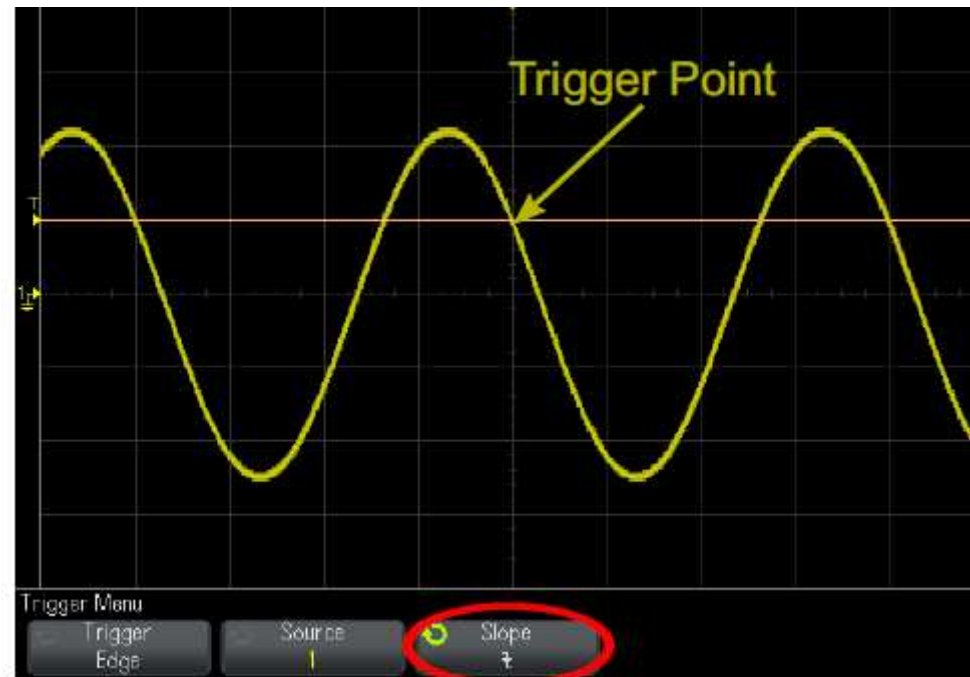

*Therefore you will be able to see the same amount of data **before** (pre) as **after** (post) the trig-event!*

# Triggering, synchronized traces

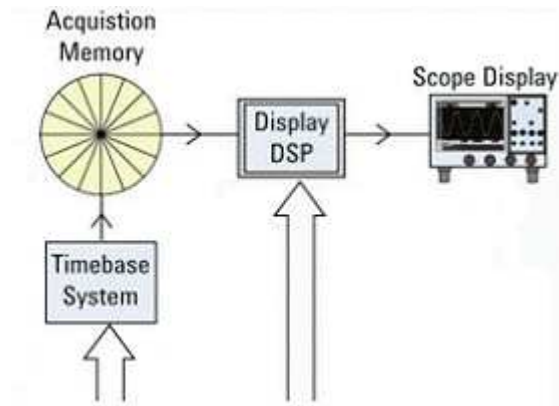

When buffer content is shown continuously in sequence on the screen, it has to be synchronized in order to give a stable trace.

Trigger-point **level**, and **slope** (slope), could be chosen arbitrary.

( *positive voltage level and negative/falling slope is the setup for this picture* ).

# Horizontal (X-axes, time)

With the "Magnifier-button" you can select a part of the trace to study in detail.

With the timebase system you change the sampling frequency for the data acquisition, and choose what part of the stored signal to display.

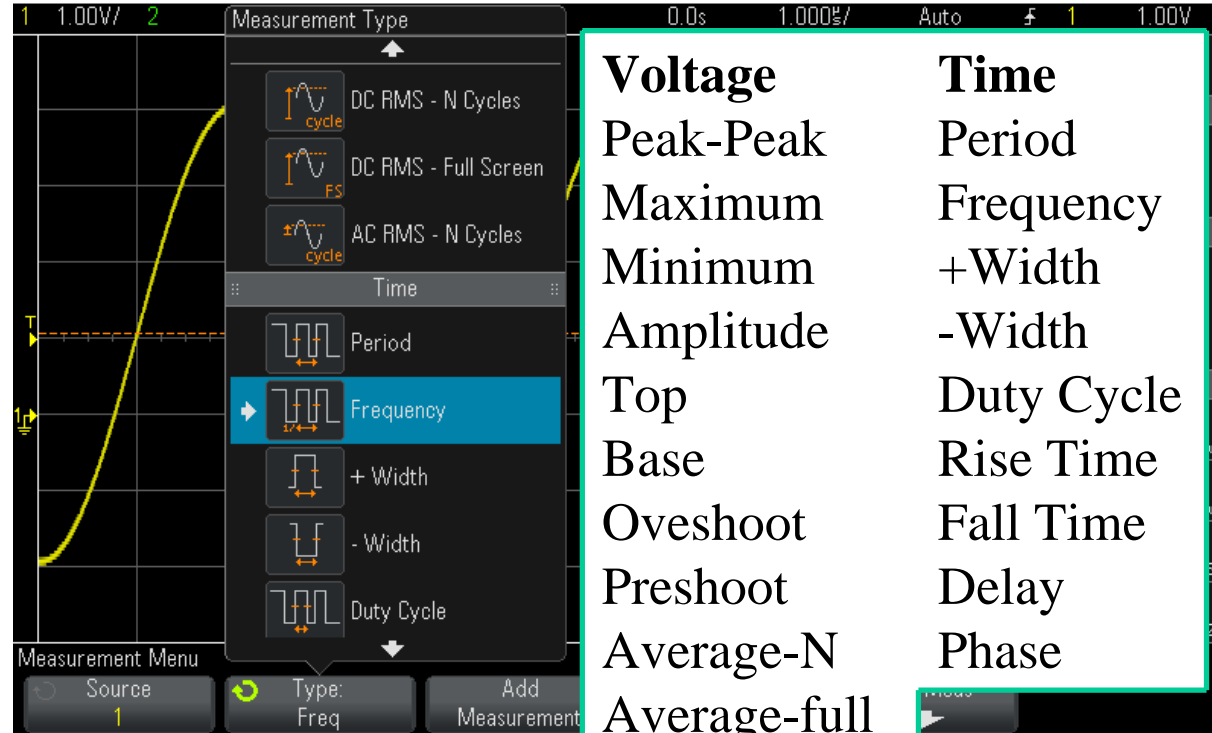

# Automatic measurements

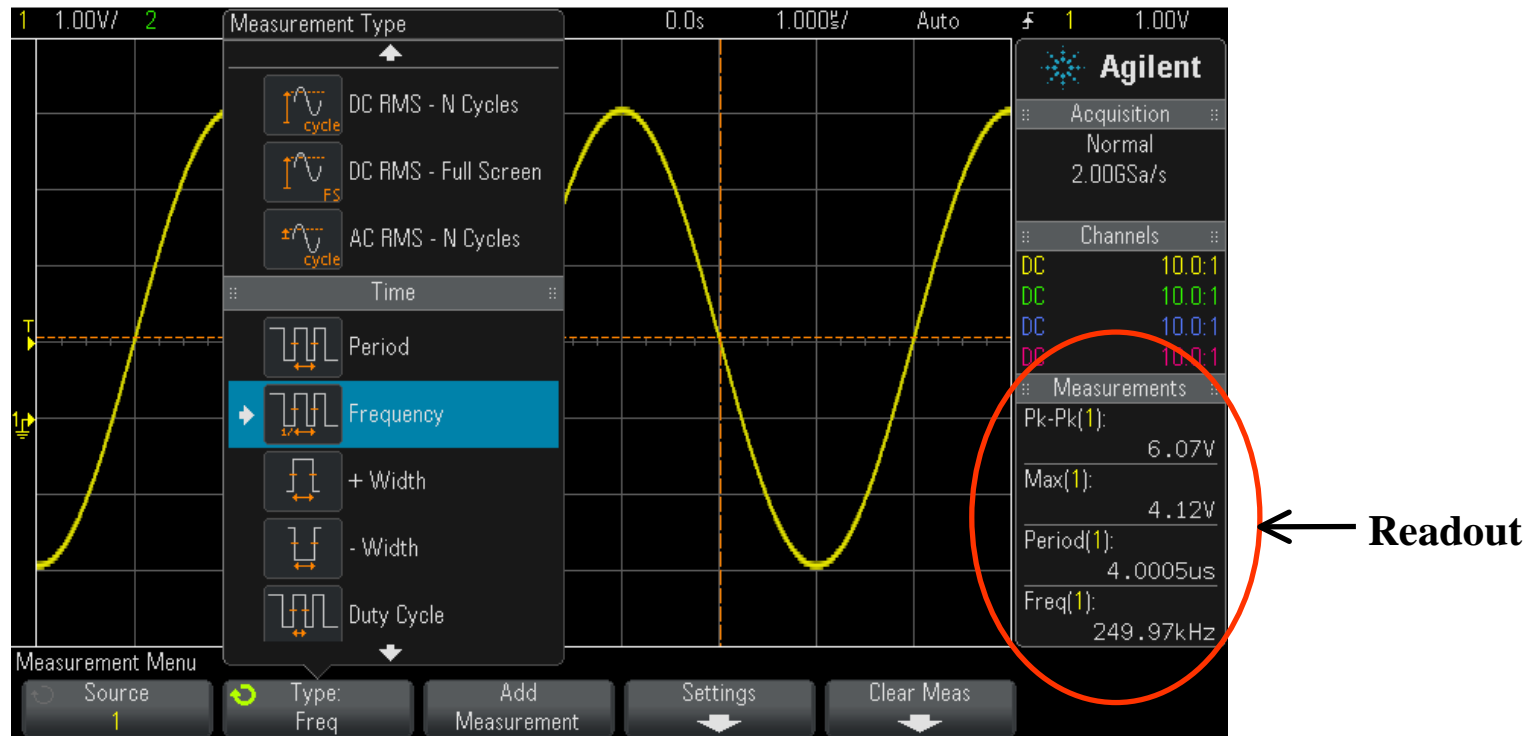

## Softkeys

- Source
- Type
- Add Measurement
- Settings
- Clear Meas

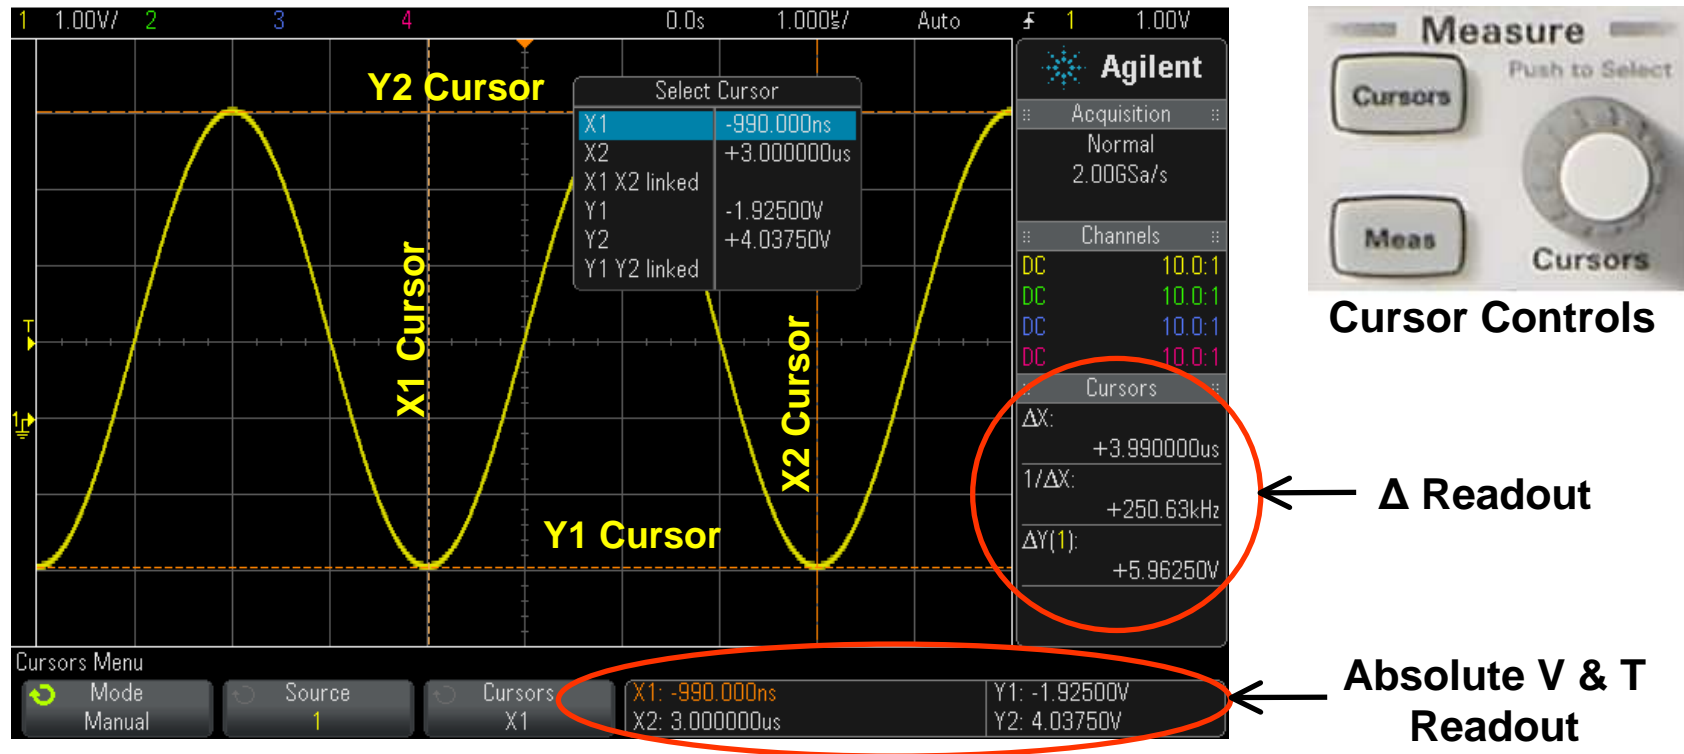

Voltage	Time
Peak-Peak	Period
Maximum	Frequency
Minimum	+Width
Amplitude	-Width
Top	Duty Cycle
Base	Rise Time
Overshoot	Fall Time
Preshoot	Delay
Average-N	Phase
Average-full	
DC-RMS-N	
DC-RMS-full	
AC-RMS-N	
AC-RMS-full	

# Automatic measurements **Frequency**

# Measurements with cursors

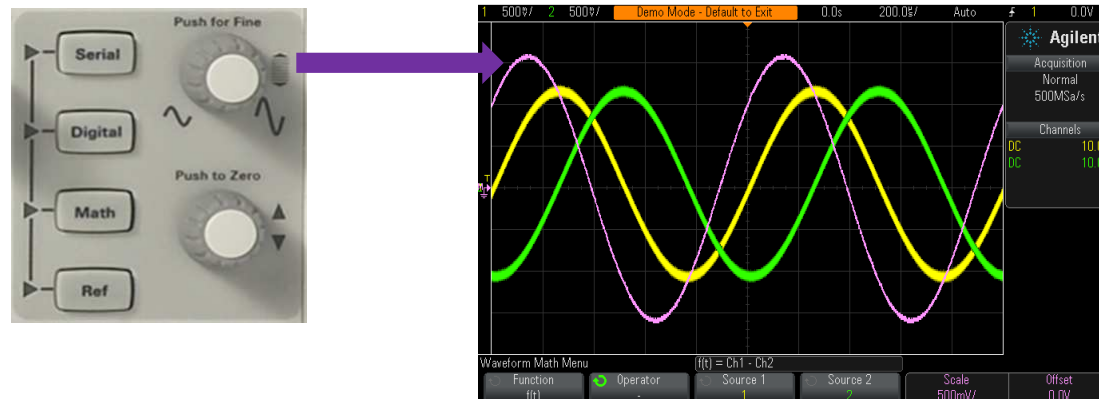

- Position X & Y cursors by hand.
- Oscilloscope uses your vertical and horizontal settings. Both absolute and differential values will show.

# Math

- + Add
- Subtract
- × Multiply

With Waveform Math you can **multiply** or **subtract** two traces with each other.

# Inbuilt training-signals

# Inbuilt training-signals

When you turn on the oscilloscope, *or* if you press **Help**, you will get access to the **Training Signals**.
