

# Project #4 –NFV ServiceChains

GROUP #4 NSC

GROUP MEMBERS: Maliha Cheema, Khalid Elbashir, Nikoletta Koutsou, Jiakun Jin, Cheng Huang, Yiting Yu

Supervised by GEORGIOS KATSIKAS and DEJAN KOSTIC

## Background

- Classically, Network Functions are Expensive, hard to manage and operate.
- Network Functions Virtualization (NFV) is an emerging trend that lack an automated framework enabling easy deployment and management
- An automated framework is required to offer the services by bridging the SDN controller with a lightweight NFV platform, driven by high-level policies.

This Approach can be divided into four parts:

- Network design
- Service Chains
- Network Management
- SDN Framework

### 1. Network design

(1) Three zones

(2) Five network service:

- DNS
- FTP
- HTTP
- VoIP
- Video streaming

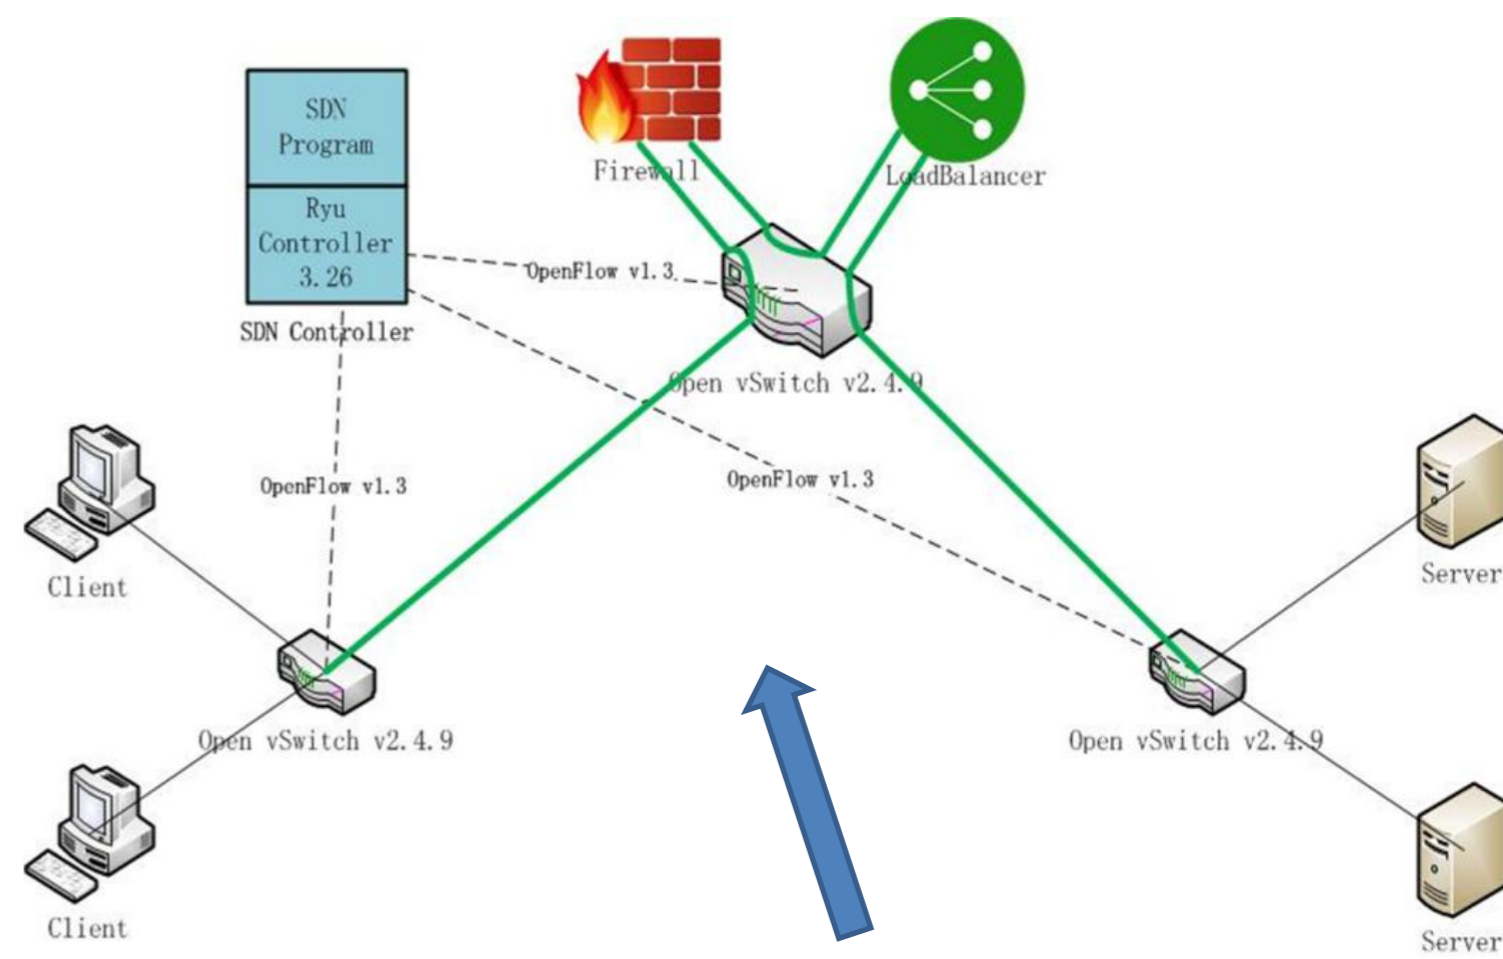

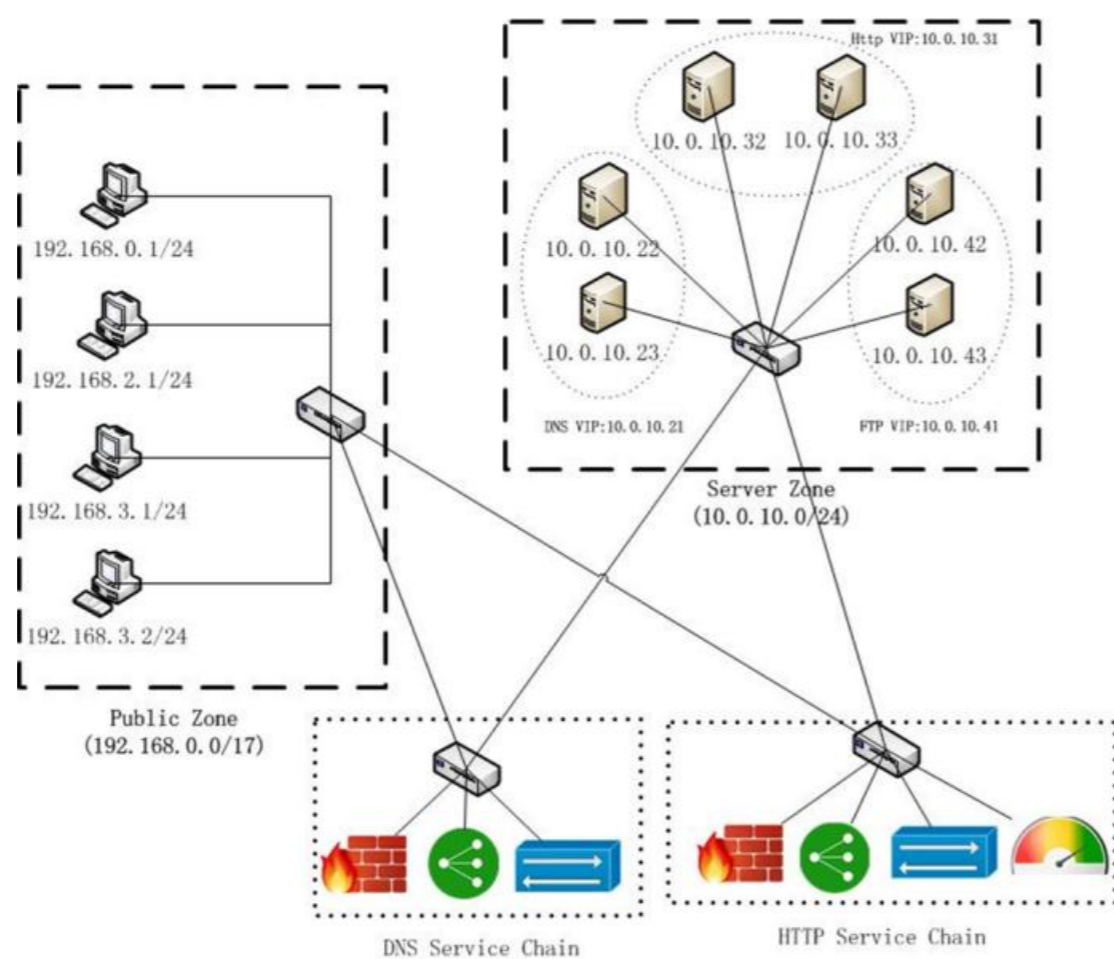

### 2. Service Chains

Four network functions:

All network functions running in docker

## Approach

### 3. Network Management

Multiple service chains will be created and monitored according to existing policy defined by user

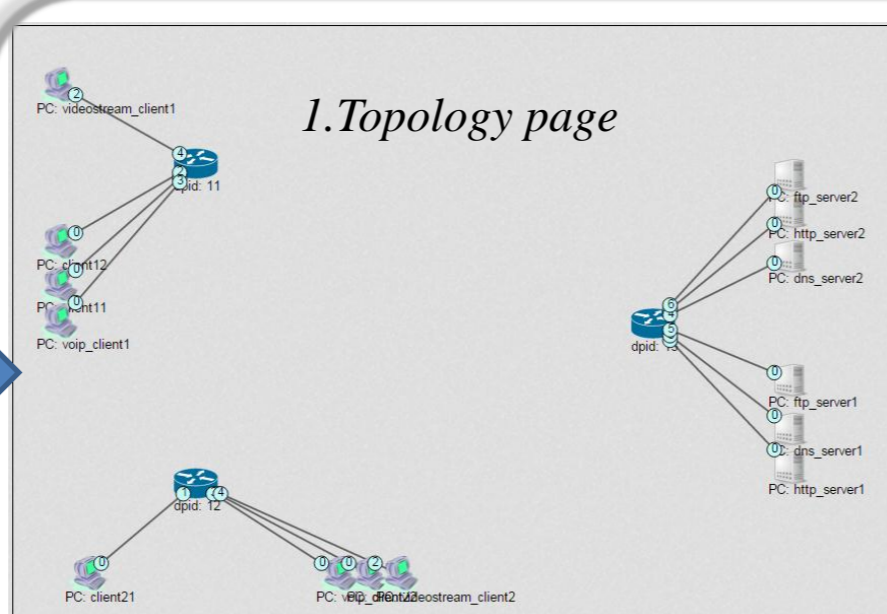

### 4. SDN Framework

- Deploy and manage the service chains
- Dynamically steer traffic across the specific chain according to its service type (follow the green line)

## Outcome

To realize the Flexible Deployment, Management and Monitoring of NFs :

- A web GUI
  - Show the topology
  - Define and manage the policies for network services
  - Show the monitoring information
- Deploy the required NFs and create the service chain according to the policy
- The SDN controller will setup the appropriate rules and steer the traffic appropriately
- The monitoring module will capture the request metrics when the traffic passing

### 2. Policies page of the web GUI:

- Define new policy (red)
- Show existing policies (blue)

## Web GUI (IP:192.16.125.174:8080)

### POLICIES

This page is used to define the policies

NEW POLICY

SERVICE	ALLOWED SUBNET	BANDWIDTH	SCHEDULER
video	192.168.2.0/24	10Mbps	OTHER

FUNCTIONS:  Firewall  NAT  LoadBalancer  QoS

Delete this policy

Define new policy Delete the existing policy

Submit

ID	SERVICE	ALLOWED SUBNET	BANDWIDTH	SCHEDULER
173	video	192.168.2.0/24	10Mbps	OTHER

NETWORK FUNCTIONS: QoS

New service chains created according to the existing policies

- ### 3. Monitoring pages
- Sub page 1:
- CPU Pinning and Utilization of NFs and Services
  - Number of input and output packets

### Sub page 2:

- Round Trip Time per NF Chain
