Information Modeling in Power Industry

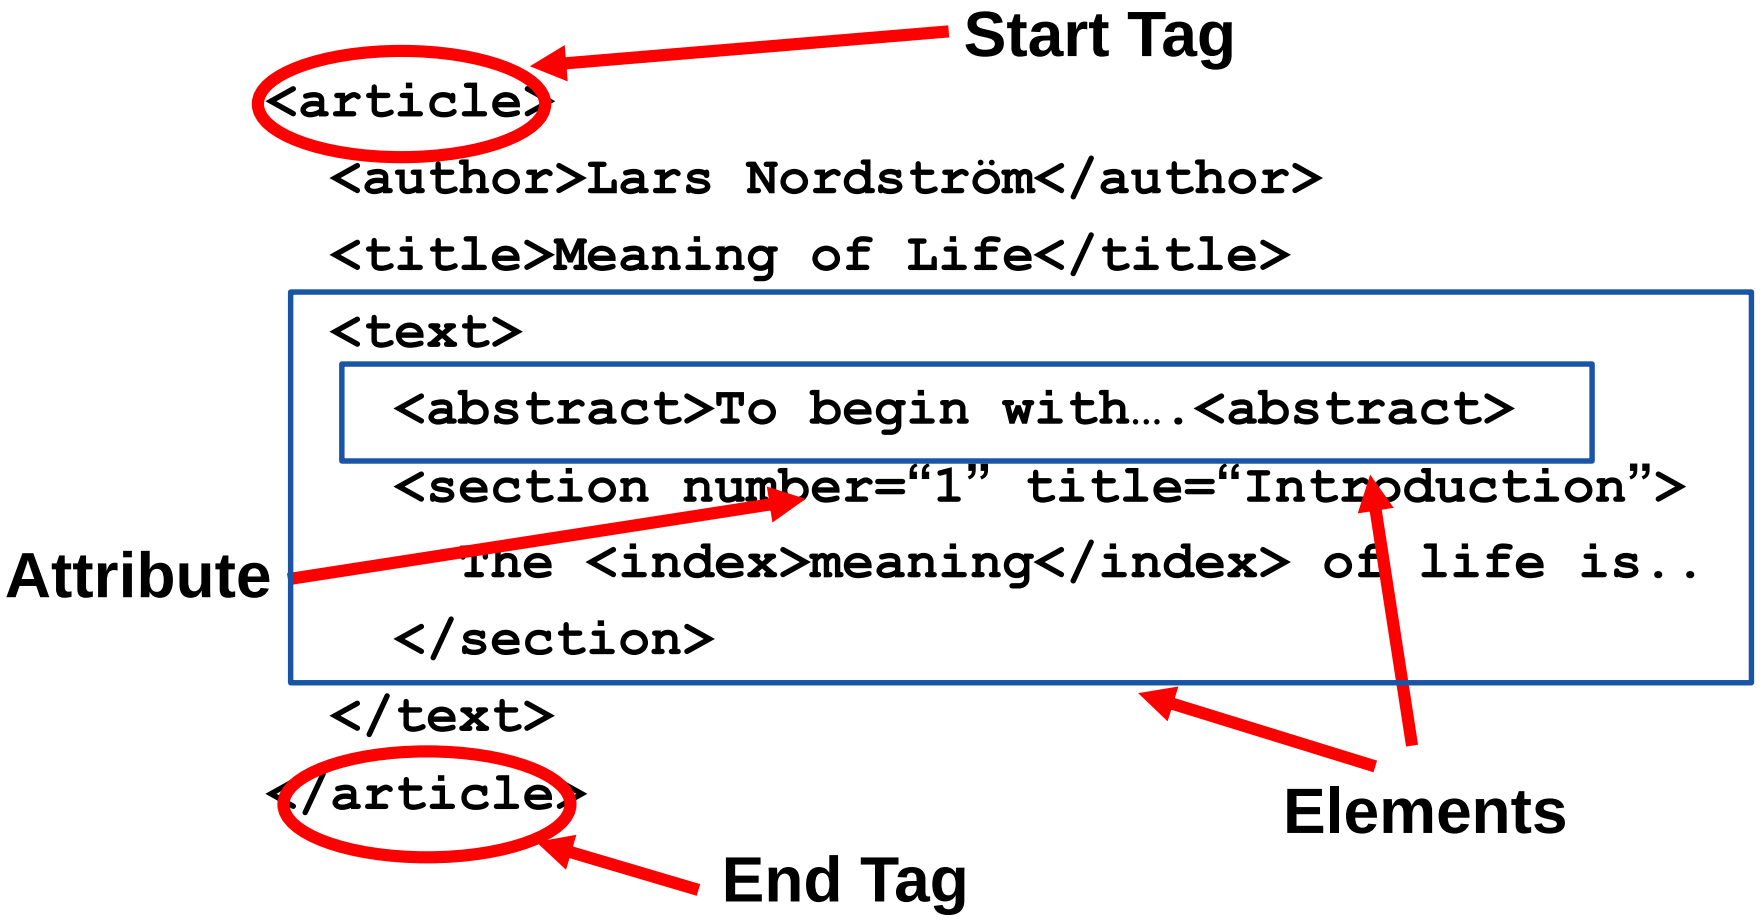
- Information Exchange Need

RDF – Resource Description Framework

Information modeling

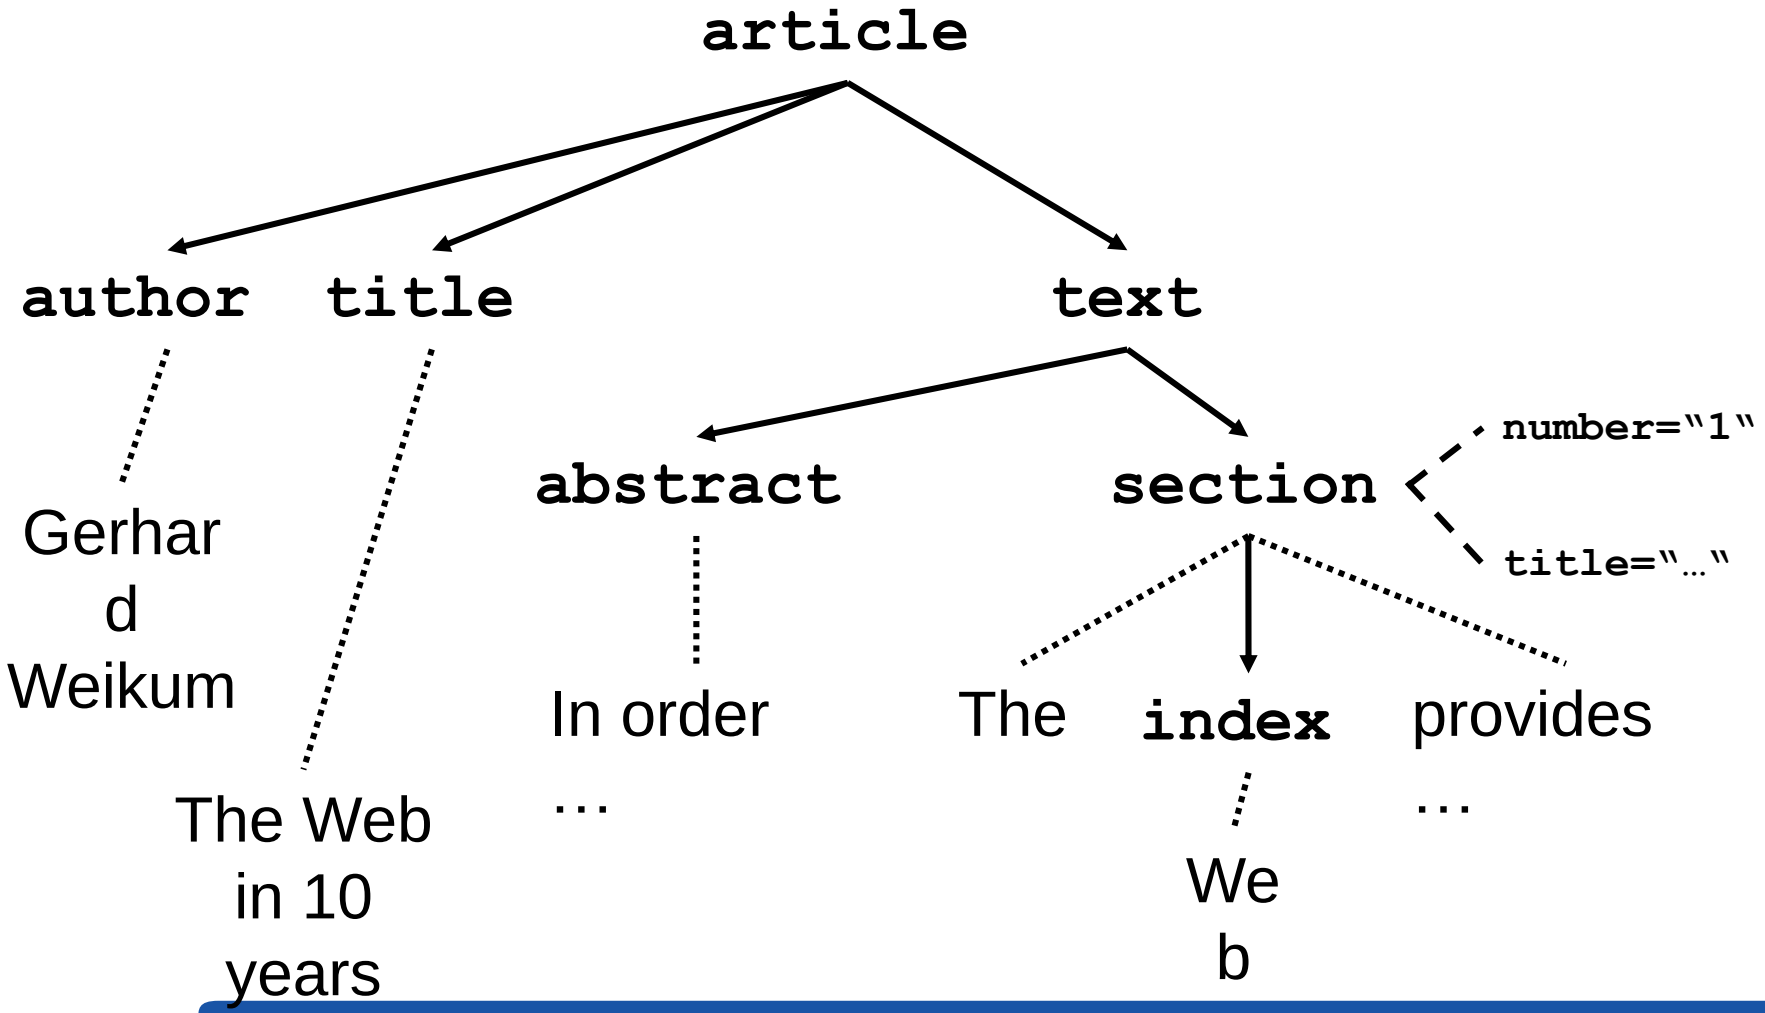
CIM based Modeling of Power Systems

A Simple XML Document



Source: XML for Beginners, Ralf Schenkel April 2003.

XML Documents as Ordered Trees

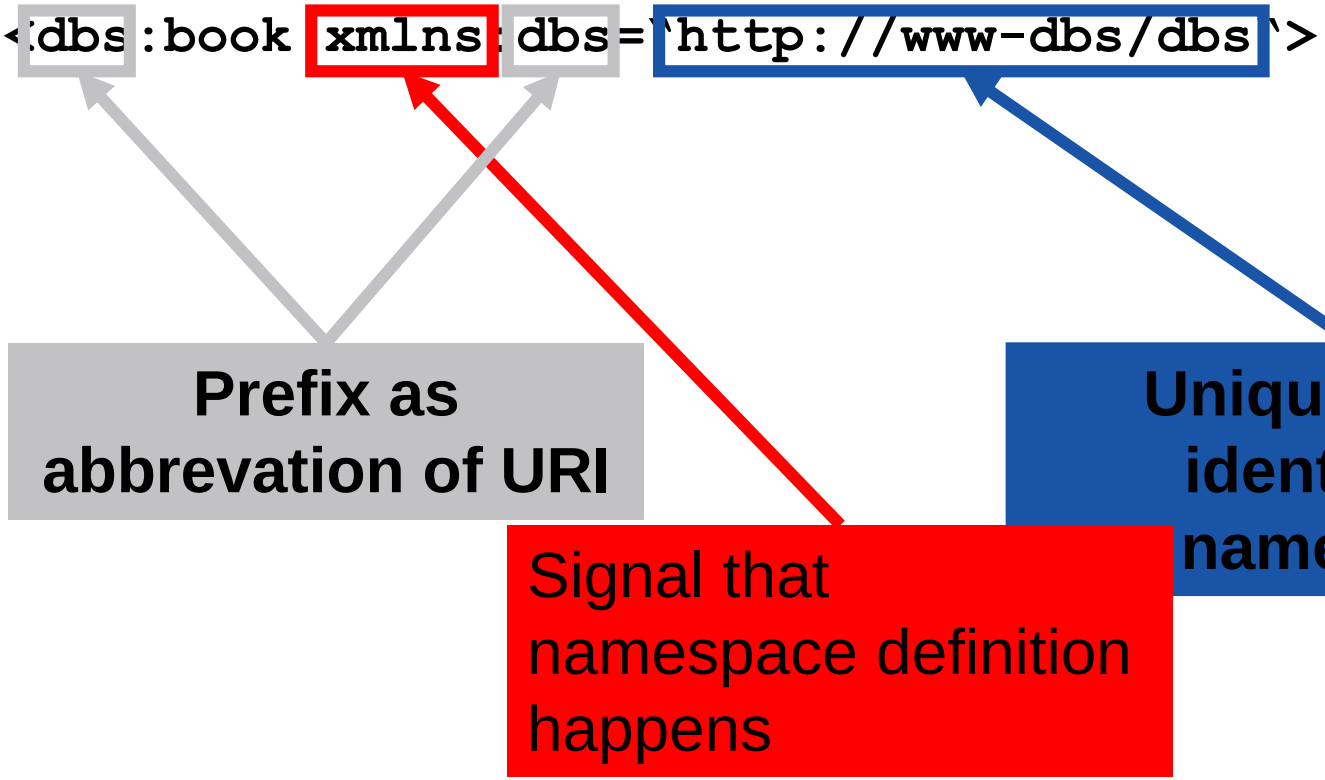


Namespaces

```
<library>
  <description>Library of the CS
    Department</description>
  <book bid="HandMS2000">
    <title>Principles of Data Mining</title>
    <description>
      Short introduction to <em>data
    mining</em>, useful
      for the IRDM course
```

Semantics of the `description` element is ambigous
Content may be defined differently
Renaming may be impossible (standards!)

Namespace Syntax

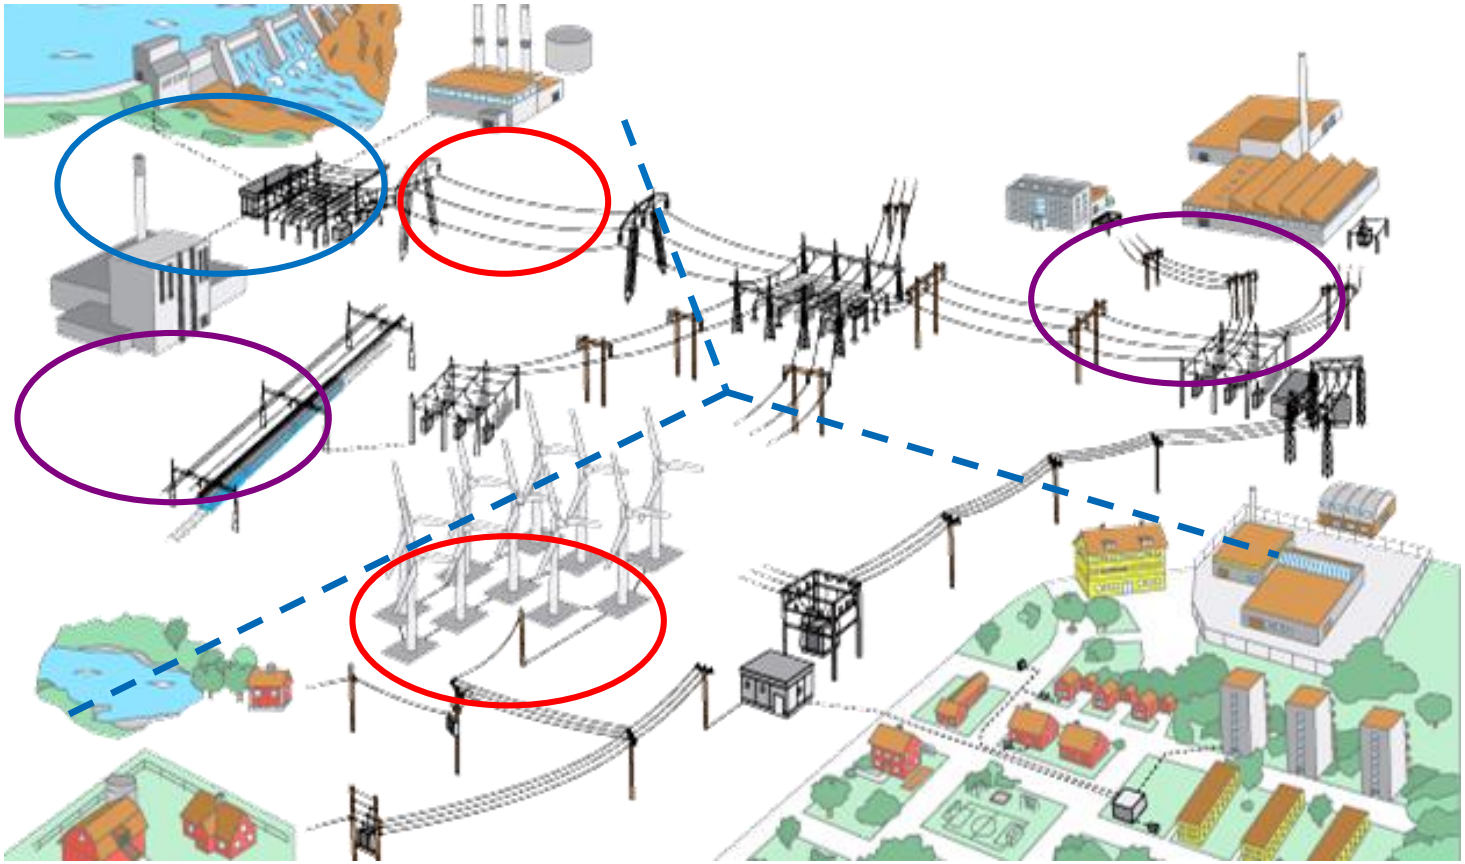


Namespace Example

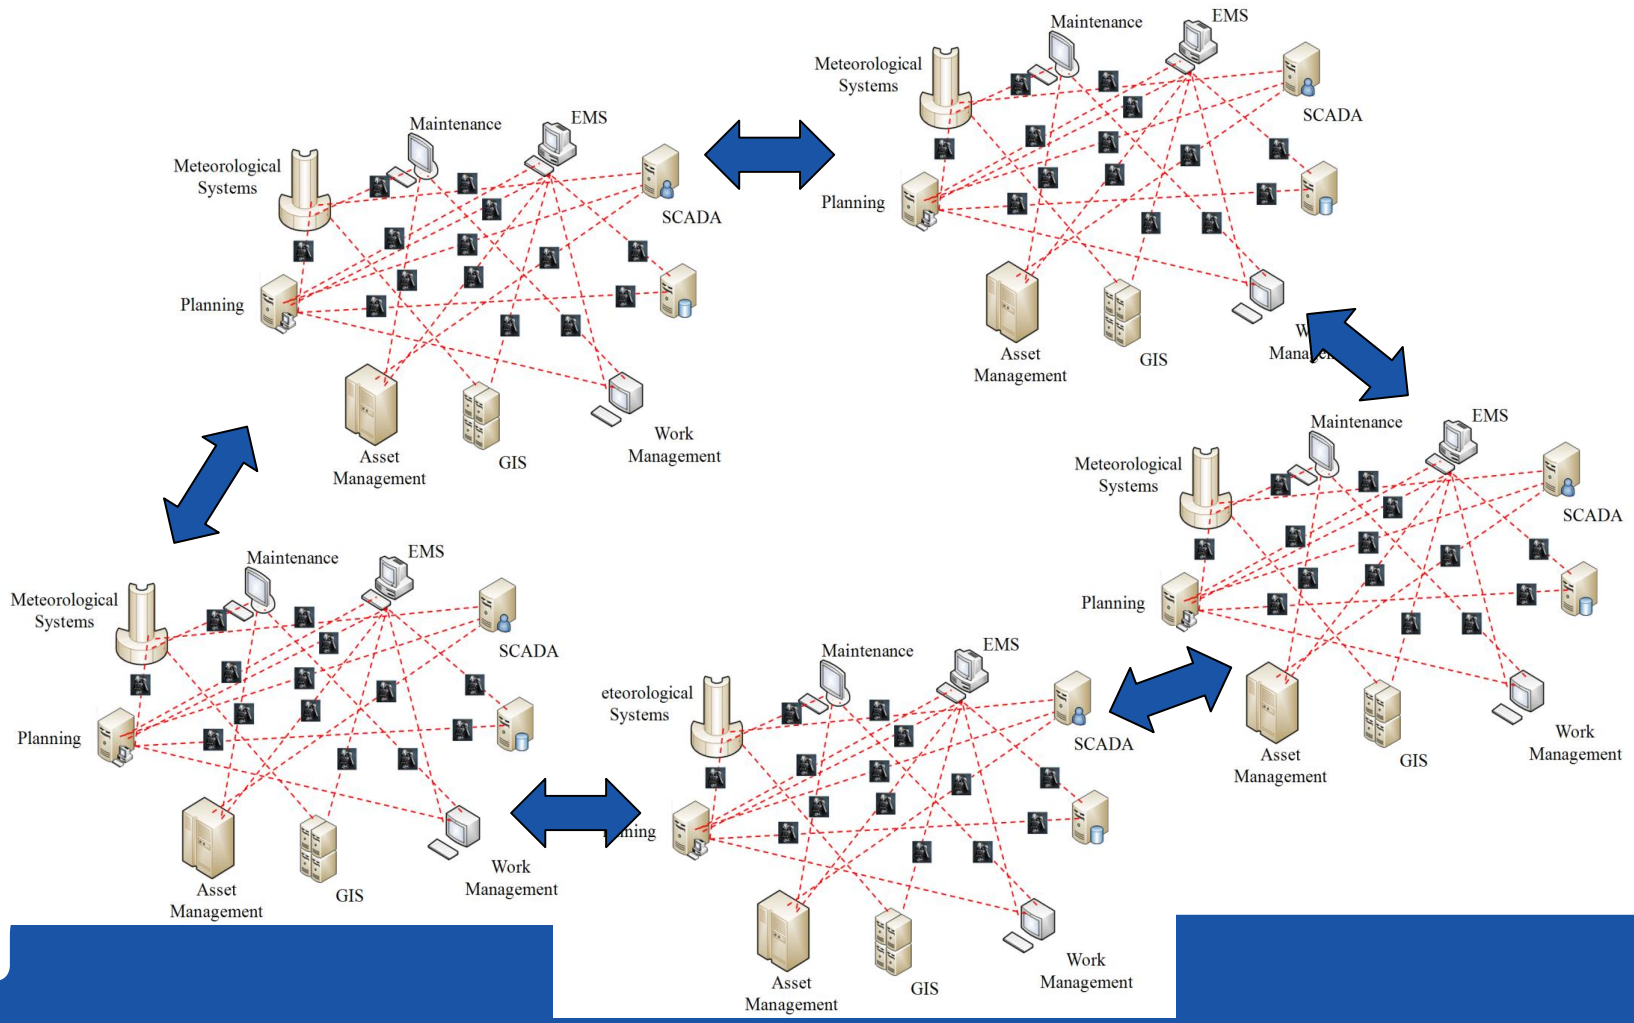
```
<dbs:book xmlns:dbs="http://www-dbs/dbs">
  <dbs:description> ... </dbs:description>
  <dbs:text>
    <dbs:formula>
      <mathml:math
xmlns:mathml="http://www.w3.org/1998/Math/MathML">
        ...
      </mathml:math>
    </dbs:formula>
  </dbs:text>
</dbs:book>
```

Contents

Deregulated Power Industry



Cross-utilities Information Exchange for planning and operation



Data Exchange needs

Exchanging measurements for enabling observability of neighbouring grids

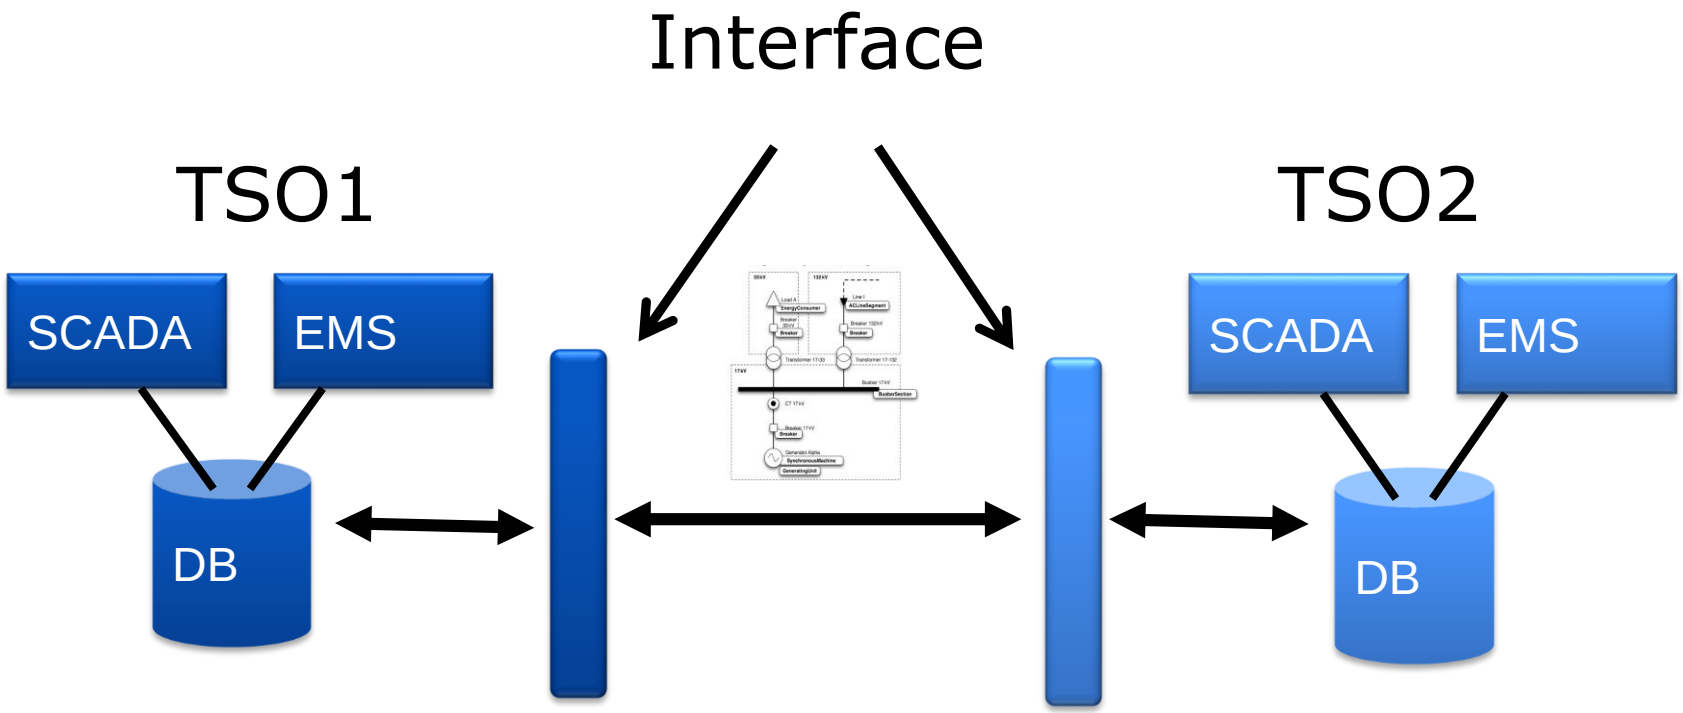
Congestion forecasting, depedning on planned production, will there be congestion?

Market settlement – how much was transfered through a line or grid section.

Exchanging information about planned interruptions.

….

Data exchange architecture



Power system model transfer between TSOs

Serialisation of the Data model

To transfer information between two systems, the data needs to be converted into some type of file/stream.

XML (just as is used in 61850) is a suitable type of file

XML file structure recap

<tag>…contained data…</tag>

But is XML expressive enough?

Contents

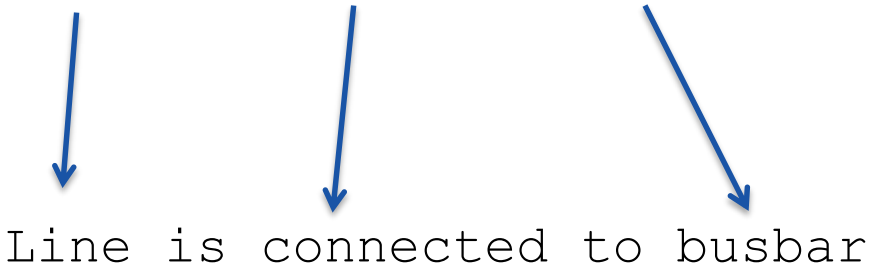
RDF

RDF is an update/use of the XML ”language” to describe relation between things.

It is based on the format:

```
Subject Predicate Object
```

For example



RDF continued

Consider the following Example:

Library data encoded in XML

```
<library name="Glasgow Library">
  <book title="History of Glasgow, 1900-1950" author="Walter Hannah">
    <position section="A" shelf="2"/>
  </book>
  <book title="A Brief History of Time" author="Stephen Hawking">
    <position section="E" shelf="4"/>
  </book>
  <book title="History of Glasgow, 1950-2000" author="Walter Hannah">
    <position section="A" shelf="2"/>
  </book>
</library>
```

How to specify that Hannah's books are related?

RDF continued

By allowing relation between XML nodes (elements) relations can be described

A key requirements is of course that nodes (elements) are uniqely identifiable – this can be achieved by `Namespaces` and URIs

URIs are pointers to unique identifers of tags. In a way the URI is the uniquness.

RDF continued,Library with RDF

```
<rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
xmlns:lib="http://www.strath.ac.uk/libraries/2006/library-schema#">
<lib:library lib:name="Glasgow Library">
  <lib:book lib:title="History of Glasgow, 1900-1950" lib:author="Walter
Hannah" rdf:ID="_entry0001">
    <lib:position lib:section="A" lib:shelf="2"/>
    <lib:sequel rdf:resource="#_entry0003"/>
  </lib:book>
  <lib:book lib:title="A Brief History of Time" lib:author="Stephen Hawking"
rdf:ID="_entry0002">

  <lib:position lib:section="E" lib:shelf="4"/>
</book>
<lib:book lib:title="History of Glasgow, 1950-2000" lib:author="Walter
Hannah" rdf:ID="_entry0003">
  <lib:position lib:section="A" lib:shelf="2"/>
  <lib:sequelTo rdf:resource="#_entry0001"/>
</lib:book>
</lib:library>
</rdf:RDF>
```

RDF Schema – defining the RDF format

- Again, we need to define what we can write in the RDF file about books.
- Just like with XML Schema, we defined what we can write in an XML document.
- Enter the RDF Schema
  - This is essentially Object oriented modeling using text/XML

RDF Schema for our library system

```
<rdfs:Class rdf:ID="book>
   <rdfs:label xml:lang="en">Book</rdfs:label>
   <rdfs:comment>A book contained within a library</rdfs:comment>
</rdfs:Class>

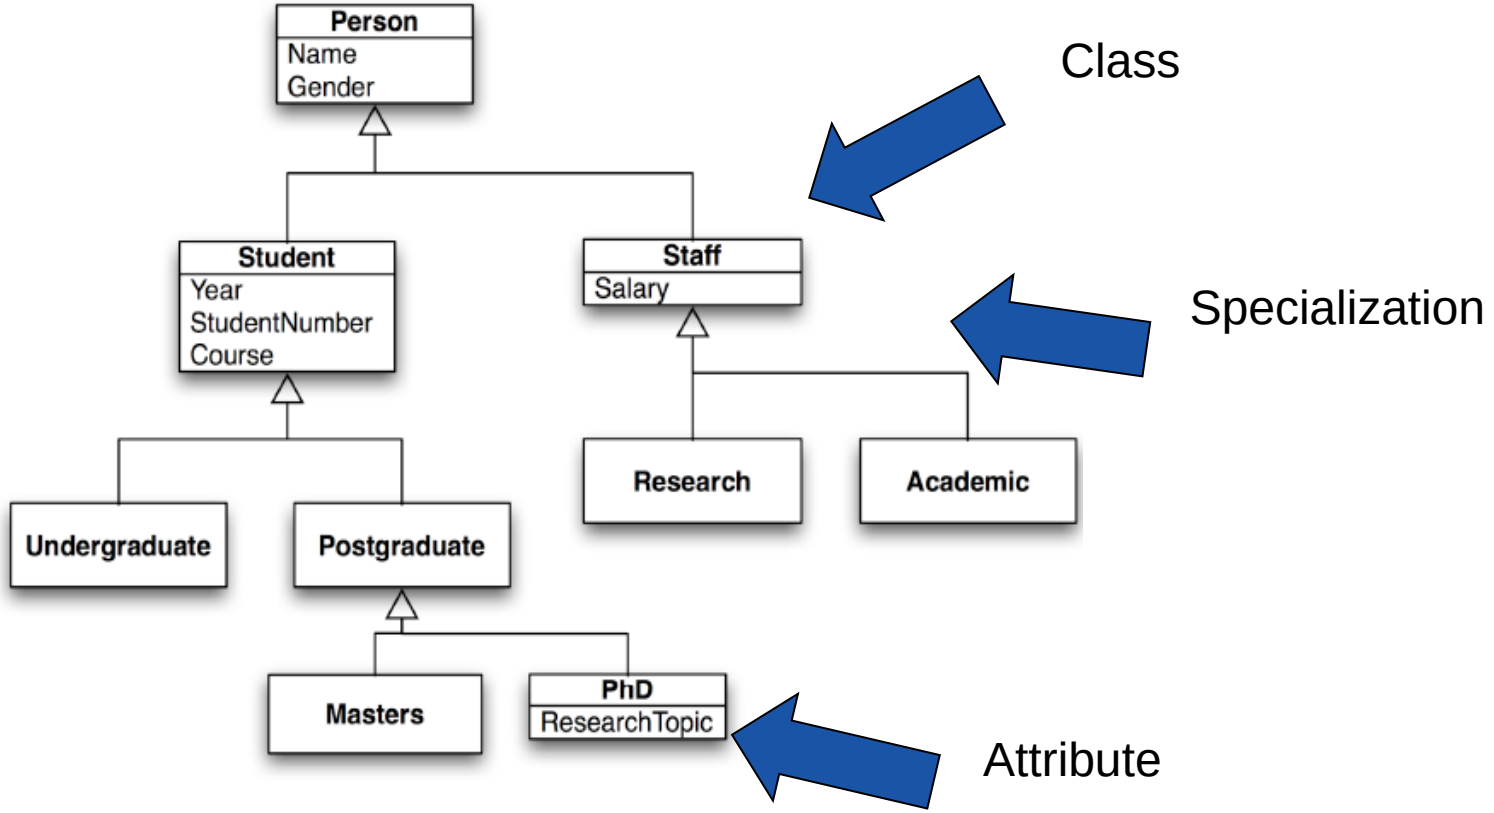
<rdf:Property rdf:ID="sequel">
   <rdfs:label xml:lang="en">Sequel</rdfs:label>
   <rdfs:comment>Indicates that the book has a sequel that is also within the
library</rdfs:comment>
   <rdfs:domain rdf:resource="#book"/>
   <rdfs:range rdf:resource="#book"/>
</rdf:Property>

<rdf:Property rdf:ID="sequelTo">
   <rdfs:label xml:lang="en">SequelTo</rdfs:label>
   <rdfs:comment>Indicates that the book is the sequel to another book also
within the library</rdfs:comment>
   <rdfs:domain rdf:resource="#book"/>
   <rdfs:range rdf:resource="#book"/>
</rdf:Property>
```

But where does the RDF Schema file come from?

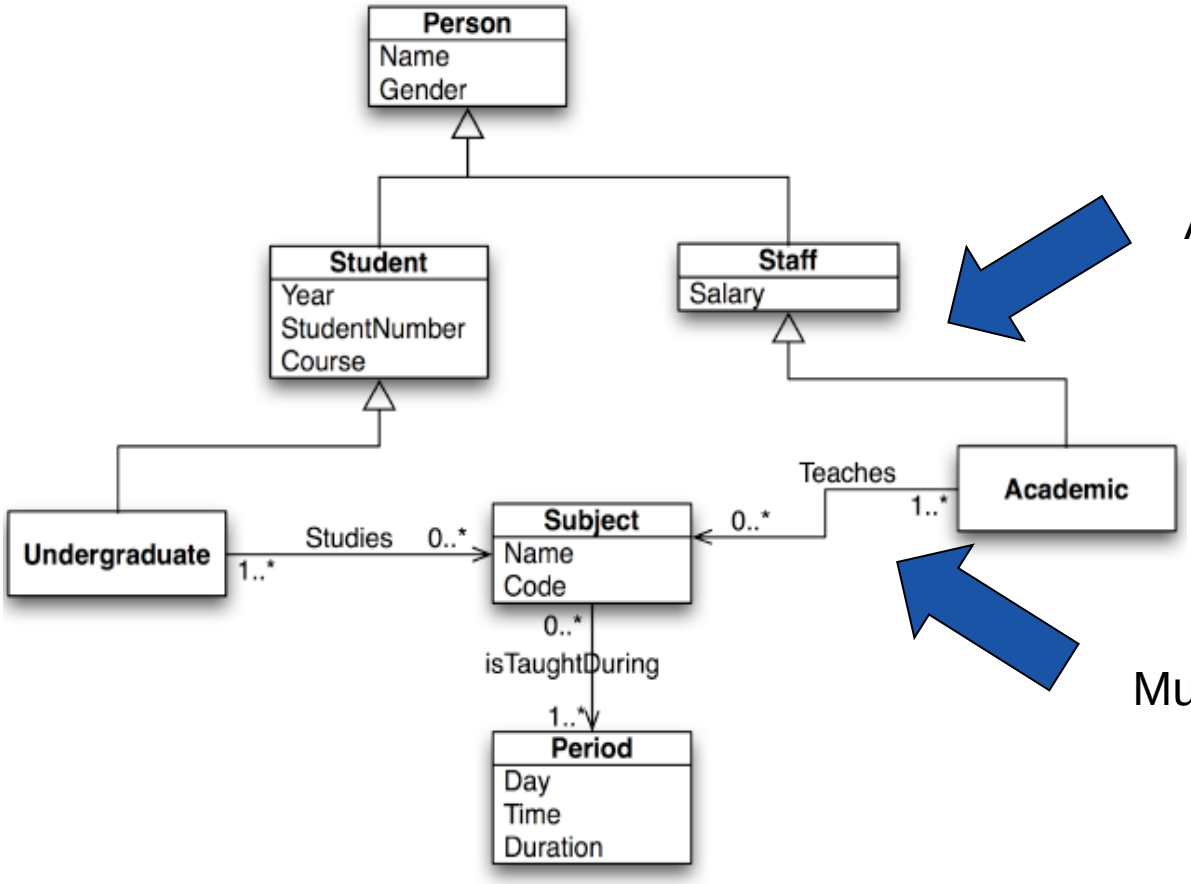
From an Information model!

Fundamentals for UML
- Class Diagram



Class Hierarchy of people at a University

Object Associations

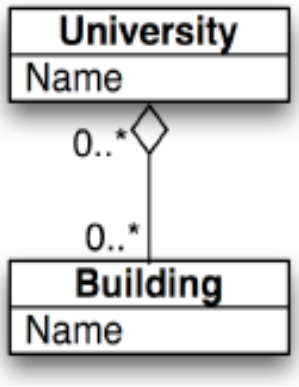


Association

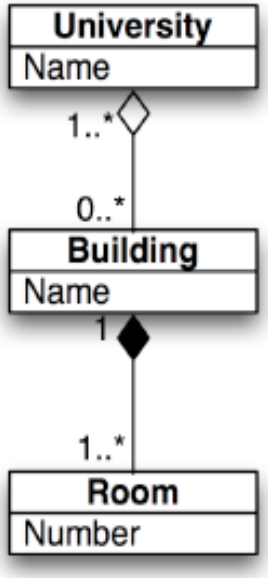
Multiplicity

Class hierarchy of students, staff and subjects

Aggregation and Composition (Association)



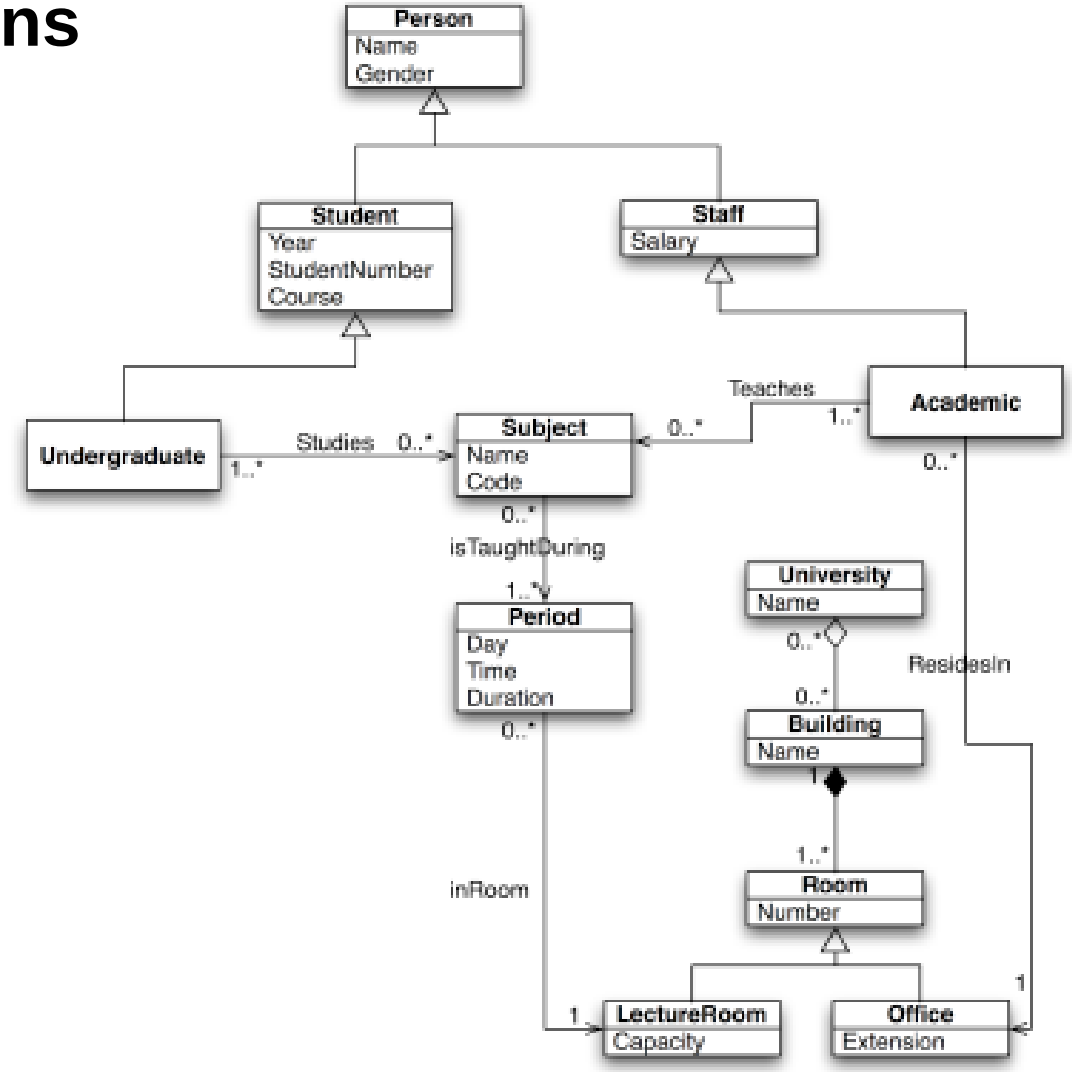
Aggregation



Composition

The Common Information Model

Classes, Associations, Aggregations and Compositions



What is the CIM?

A Unified Modeling Language (UML) based information model representing real-world objects and information entities exchanged within the value chain of the electric power industry

A tool to enable integration and information exchange to enable data access in a standard way

A common language to navigate and access complex data structures in any database

It is not tied to a particular vendor's view of the world

It also provides consistent view of the world by operators regardless of which application user interface they are using

Courtesy of T.Saxton TC57 WG13 chairman

IEC 61970-301

Semantic model that describes the components of a power system and the relationships between each component

Exchange of data between transmission system operators

Enabling power flow calculation/state estimation on neighbouring transmission systems

Not yet for dynamic calculations

Now we can “define” the CIM RDFSchema

```
<rdfs:Class rdf:ID="PowerSystemResource">
   <rdfs:label xml:lang="en">PowerSystemResource</rdfs:label>
   <rdfs:subClassOf rdf:resource="#Naming"/>
</rdfs:Class>

<rdfs:Class rdf:ID="Equipment">
   <rdfs:label xml:lang="en">Equipment</rdfs:label>
   <rdfs:subClassOf rdf:resource="#PowerSystemResource"/>
</rdfs:Class>

<rdfs:Class rdf:ID="ConductingEquipment">
   <rdfs:label xml:lang="en">ConductingEquipment</rdfs:label>
   <rdfs:subClassOf rdf:resource="#Equipment"/>
</rdfs:Class>
```
