ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

2

Network. Internet

A **network** is a hardware and software data communication system that provides interconnection of computers and other devices.

An *internet* is a set of networks connected with routers.

Networks and Interprocess

Vladimir Vlassov and Johan Montelius

Communication

The Internet is the largest internet that includes commercial, military, university and other networks with different physical links and various protocols including IP (Internet Protocol)

Types of networks

- WAN Wide Area Networks
- MAN Metropolitan Area Networks
- LAN Local Area Networks
- PAN Personal Area Networks

Latency

Transfer rate:

What is the rate at which we can send data?

Performance

- Latency how long time does it take to send an empty message?
- Transfer rate what is the rate at which we can send data?

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

Latency

Why does it take time to send a message?

- distance speed of signal (light)
- · access granting of resource
- routing processing in nodes

fast as ..

What is the speed of light? 300 000 km/s ... or 300 km/ms

Distance in ms:

Stockholm - Hamburg approx. 800 km or 3 ms

Stockholm - NYC approx. 6.600 km or 23 ms

Stockholm - Melbourne approx. 15.600 km or 52 ms

Routers. switches and fiber optics adds to this so Melbourne is approx. 300 ms away.

ping

```
↑ vladv - bash - 80×24
pc65:~ vladv$ ping www.aflcommunityclub.com.au
PING www.aflcommunityclub.com.au (202.74.66.109): 56 data bytes
64 bytes from 202.74.66.109: icmp_seq=0 ttl=43 time=371.140 ms

64 bytes from 202.74.66.109: icmp_seq=11 ttl=43 time=605.175 ms
64 bytes from 202.74.66.109: icmp_seq=12 ttl=43 time=520.319 ms
--- www.aflcommunityclub.com.au ping statistics ---
13 packets transmitted, 12 packets received, 7.7% packet loss
round-trip min/avg/max/stddev = 367.141/495.466/683.341/112.186 ms
pc65:~ vladv$
```

Using ICMP packages might give a better value, UDP might be slower.

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

Latency in different networks

• LAN/WLAN - local area networks (Ethernet/WiFi) 1 - 10 ms

WAN - wide area networks (IP routed)
 20 - 400 ms

Mobile networks
 40 - 800 ms

Satellite (geo-stationary) > 250 ms

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

10

Message size

How does latency vary with the size of the messages?

Transfer rate

The rate at which we can send data (does not mean that it has arrived).

What is the transfer rate of:

ADSL 1 - 20 Mb/s

Ethernet 100 Mb/s - 1 Gb/s

802.11 11 Mb/s, 54 Mb/s, 72 Mb/s ... 3G/4G 11 Mb/s, 2 Mb/s, ... 100 Mb/s

Is this shared with others?

Overhead

medium access: 802.11 - RTS/CTS

error handling: detection, forward error correction, ARQ

header: MAC header, IP header, TCP ...

flow control: TCP window

What's in it for me?

The application layer transfer rate is much lower than the physical layer bit rate.

How does the application layer latency differ from the network layer latency?

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

.

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

14

Latency and transfer rate

Stockholm to Gothenburg - 400 km, best possible data communication layer?

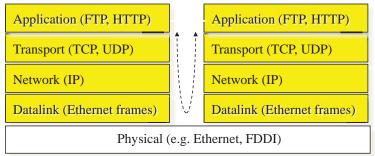

10 Gbit/s

Multi-Layered Network Architecture

The seven-layer OSI (Open System Interconnect) model The IP networking stack includes 5 layers

Communication layers

Application the end product

Presentation encoding of information, serialization, marshaling

Session security, authentication, initialization

Transport messages, streams, reliability, flow control

Network addressing of nodes in a network, routing, switching

Data link point to point deliver of frames, medium access, link control

Physical layer bits to analog signals, electrical, optical, radio ...

Internet stack

HTTP, FTP, SMTP TCP, UDP, SCTP, ICMP

IP, ARP

Ethernet, WiFi, ..

40

What if

What would the world look like ...

.. if we only had Ethernet?

Routing

Two approaches:

- Distance vector: send routing table to neighbors, RIP, BGP
- Link state: tell everyone about your direct links, OSPF

Pros and cons?

IP addresses

What is the structure of an IP address?

How would you allocate IP addresses to make routing easier?

What is actually happening?

IP Address Classes

A (1-126.x.x.x) – 126 address blocks, each of 16,000,000 addresses.

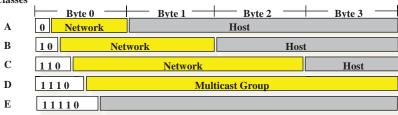

B (128-191.x.x.x) – one address block contains ~65,000 addresses.

C (192-223.x.x.x) – one address block contains 254 addresses.

D (224-239.x.x.x) - multicast addresses.

E (240-255.x.x.x) -reserved.

Classes

21

UDP and TCP

One word that describes the difference between UDP and TCP.

UDP and **TCP**

Introduces two communication abstractions:

- UDP: datagram
- TCP: stream
- Gives us port numbers to address processes on a node.
- About hundred other protocols defined using IP. (ICMP, IGMP, RSVP, SCTP...)
- More protocols defined on top of UDP and TCP.

UDP

KTH

TCP

- A datagram abstraction, independent messages, limited in size.
- Low cost, no set up or tear down phase.
- No acknowledgment.

- A duplex stream abstraction.
- Reliability, lost or erroneous packets are retransmitted.
- Flow control, to prevent the sender from flooding the receiver.
- Congestion friendly, slows down if a router is choked.

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

2

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

. .

UDP and TCP

TCP: large size messages, flow control of a stream of messages

Can you trust TCP delivery?

Sockets

Socket is the programmer's abstraction of the network layer

- an end point a virtual network connection;
- identified by an IP address & port number, and a transport protocol (TCP, UDP, ...)
 - Datagram sockets for messages (UDP)
 - Stream sockets for duplex byte streams (TCP)

Sockets, a.k.a. Berkeley sockets, were introduced in 1981 as the Unix BSD 4.2 generic API for inter-process communication

- Earlier, a part of the kernel (BSD Unix)
- Now, a library (Solaris, MS-DOS, Windows, OS/2, MacOS)

Stream Socket

A TCP socket for stream-based communication

- Server
 - Creates a listen socket bound to a port (could be in several steps: create, bind, listen)
 - Accepts incoming connection request and creates a communication socket used for reading/writing a byte stream.
- Client
 - Creates a communication socket and connects it to a server identified by an IP address and a port.
 - Reads/writes from socket.

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

A Server in Erlang

```
handler(Listen) ->
   case gen_tcp:accept(Listen) of
     {ok, Client} ->
        request(Client),
        handler(Listen);
     {error, Error} ->
        error
   end.
```

ID2201 DISTRIBUTED SYSTEMS / NETWORKS AND INTERPROCESS COMMUNICATION

20

A Server in Erlang

```
reply(Request) ->
:
generate and return
a byte sequence
```

Datagram socket

- Server
 - Create a message socket and bind it to a port.
 - Receive an incoming message (message contains a source IP address and port number).
- Client
 - Create a message socket bound to a source port.
 - Create a message and give it a destination address and port number.
 - Send the message.

Marshaling of data

How do we transform internal data structure into sequencing of bytes?

- Language dependent: Java serialization, Erlang external term format
- Independent: XML, Google Protocol Buffer, ASN.1
 - message format defined by specification: XML Schema, .proto, ...
 - specification is used by a compiler to generate encoder and decoder

Example

```
ANS.1 specification

C data structures

FooProtocol DEFINITIONS ::= BEGIN struct foo_question {
FooQuestion ::= SEQUENCE {
    int tracking_number;
    trackingNumber INTEGER,
    question IA5String}
FooAnswer ::= SEQUENCE {
    questionNumber INTEGER,
    answer BOOLEAN}

END
```

. .

Summary

The application layer should in a perfect world be independent of underlying layers.

The world is not perfect.

Understanding underlying network characteristics is essential when developing distributed applications.
