Introduction to XML

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ XML is a universal way of storing and transferring **data of any kind**.
- ▶ Specification maintained by W3C.
- ▶ All documents written with an XML-derived markup language can be parsed with **the same parser**.

Introduction to XML (Cont'd)

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ An XML document contains only text.

Introduction to XML (Cont'd)

- ▶ An XML document contains only text.
- ▶ Data is marked up using tags:

```
<name>  
  Stina  
</name>
```

XML

Other XML
Standards

Introduction to XML (Cont'd)

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ An XML document contains only text.
- ▶ Data is marked up using tags:

```
<name>  
  Stina  
</name>
```

- ▶ Human readable and machine readable.

Terminology

- ▶ An XML-based markup language is a **tag set**, or an **XML application**.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Terminology

- ▶ An XML-based markup language is a **tag set**, or an **XML application**.
- ▶ A document using an XML-based markup language is an **XML document**.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Terminology

- ▶ An XML-based markup language is a **tag set**, or an **XML application**.
- ▶ A document using an XML-based markup language is an **XML document**.
- ▶ An **XML processor** is a program that parses XML documents and provides the parts to an application.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Terminology (Cont'd)

- ▶ A **tag** defines an **element**. The XML below has the **opening tag** `<name>`, the **closing tag** `</name>` and the whole line is an **element**.

```
<name>Sara</name>
```

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

Terminology (Cont'd)

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ A **tag** defines an **element**. The XML below has the **opening tag** `<name>`, the **closing tag** `</name>` and the whole line is an **element**.

```
<name>Sara</name>
```

- ▶ The text between the opening and closing tag, **Sara** in the example above, is the elements **content**.

Terminology (Cont'd)

- ▶ There are **empty elements**,
<optional/>.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Terminology (Cont'd)

- ▶ There are **empty elements**,
`<optional/>`.
- ▶ Tags may have attributes,
`<order id=abc123 />`.

XML

essors

Another Example

`<H1>Skateboard Usage Requirements</H1>`

`<P>In order to use the FastGlide
skateboard you have to have:</P>`

`<LIST>`

`<ITEM> A strong pair of legs.</ITEM>`

`<ITEM> A reasonable long stretch of smooth
road surface.</ITEM>`

`<ITEM> The impulse to impress others.</ITEM>`

`<P>If you have all of the above, you can
proceed to <LINK HREF="Chapter2.xml">Getting
on the Board</LINK>.</P>`

XML Syntax

- ▶ The syntax of XML is divided in two distinct levels.

XML Syntax

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ The syntax of XML is divided in two distinct levels.
 1. The **general low-level rules** that apply to all XML documents and tag sets.

- ▶ The syntax of XML is divided in two distinct levels.
 1. The **general low-level rules** that apply to all XML documents and tag sets.
 2. A particular XML tag set, defined with either a **Document Type Definition (DTD)** or an **XML schema**.

General Low Level Rules

- ▶ The document contains **only Unicode characters**.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules

- ▶ The document contains **only Unicode characters**.
- ▶ The special characters (e.g. < or &) are used **only for markup**.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules

- ▶ The document contains **only Unicode characters**.
- ▶ The special characters (e.g. < or &) are used **only for markup**.
- ▶ Tags are **correctly nested**, with none missing and none overlapping.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules

- ▶ The document contains **only Unicode characters**.
- ▶ The special characters (e.g. < or &) are used **only for markup**.
- ▶ Tags are **correctly nested**, with none missing and none overlapping.
- ▶ Tags are **case-sensitive**, the start and end tags must **match exactly**.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules (Cont'd)

- ▶ Tag names cannot **start** with `-`, `.`, or a digit.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules (Cont'd)

- ▶ Tag names cannot **start** with -, ., or a digit.
- ▶ Tag names cannot **contain** a space character or any of the characters % ! " # & () * + , / ; < = > ? @ [\] ^ ' { | }

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules (Cont'd)

- ▶ Tag names cannot **start** with -, ., or a digit.
- ▶ Tag names cannot **contain** a space character or any of the characters % ! " # & () * + , / ; < = > ? @ [\] ^ ' { | }
- ▶ A single **root element** contains all the other elements.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules (Cont'd)

- ▶ Tag names cannot **start** with `-`, `.`, or a digit.
- ▶ Tag names cannot **contain** a space character or any of the characters `%` `!` `"` `#` `&` `(` `)` `*` `+` `,` `/` `;` `<` `=` `>` `?` `@` `[` `\` `]` `^` `'` `{` `|` `}`
- ▶ A single **root element** contains all the other elements.
- ▶ All XML documents begin with an **XML declaration** specifying XML standard version and character encoding:

```
<?xml version = "1.0" encoding = "utf-8"?>
```

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

General Low Level Rules (Cont'd)

- ▶ Tag names cannot **start** with `-`, `.`, or a digit.
- ▶ Tag names cannot **contain** a space character or any of the characters `%` `!` `"` `#` `&` `(` `)` `*` `+` `,` `/` `;` `<` `=` `>` `?` `@` `[` `\` `]` `^` `'` `{` `|` `}`
- ▶ A single **root element** contains all the other elements.
- ▶ All XML documents begin with an **XML declaration** specifying XML standard version and character encoding:

```
<?xml version = "1.0" encoding = "utf-8"?>
```

- ▶ An XML document that follows all of these rules is **well formed**.

XML

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Nested Tags Instead of Attributes

- ▶ Attributes are used more **restrictively** in XML than in HTML.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Nested Tags Instead of Attributes

- ▶ Attributes are used more **restrictively** in XML than in HTML.
- ▶ In XML, you normally define a **nested tag instead of an attribute** to provide more information about the content of a tag.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Nested Tags Instead of Attributes

- ▶ Attributes are used more **restrictively** in XML than in HTML.
- ▶ In XML, you normally define a **nested tag instead of an attribute** to provide more information about the content of a tag.
- ▶ Nested tags are preferred, since **attributes cannot describe structure**. Think of tags as **objects** and attributes as **fields** in the objects.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Nested Tags Instead of Attributes

- ▶ Attributes are used more **restrictively** in XML than in HTML.
- ▶ In XML, you normally define a **nested tag instead of an attribute** to provide more information about the content of a tag.
- ▶ Nested tags are preferred, since **attributes cannot describe structure**. Think of tags as **objects** and attributes as **fields** in the objects.
- ▶ Attributes should be used primarily to identify **numbers or names** of elements (like HTML **id** and **name** attributes).

XML

Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Nested Tags Instead of Attributes (Cont'd)

```
<!-- Attribute -->
<patient name = "Maggie Dee Magpie">
    ...
</patient>
```

```
<!-- Nested tag -->
<patient>
    <name> Maggie Dee Magpie </name>
    ...
</patient>
```

```
<!-- Nested tag, which has nested tags -->
<patient>
    <name>
        <first> Maggie </first>
        <middle> Dee </middle>
        <last> Magpie </last>
    </name>
    ...
</patient>
```

[XML](#)[Document Type

Standards](#)

XML Entities

- ▶ A reference to an entity has the form
&entity_name;

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

XML Entities

- ▶ A reference to an entity has the form `&entity_name;`
- ▶ Predefined entities (as in HTML):

<code><</code>	<code>&lt;</code>
<code>></code>	<code>&gt;</code>
<code>&</code>	<code>&amp;</code>
<code>"</code>	<code>&quot;</code>
<code>'</code>	<code>&apos;</code>

For instance

```
<message>  
  if salary &lt; 1000 then  
</message>
```

Question 1

Section

- XML
- Document Type Definition, DTD
- XML Namespaces
- XML Schema
- XML Processors
- Other XML Standards

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

What is a DTD?

- ▶ A Document Type Definition (DTD) **defines the structure** of an XML document.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

What is a DTD?

- ▶ A Document Type Definition (DTD) defines the structure of an XML document.
- ▶ The DTD defines which elements are allowed, their order, their attributes and their content.

[XML](#)[Document Type Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML Standards](#)

What is a DTD?

- ▶ A Document Type Definition (DTD) defines the structure of an XML document.
- ▶ The DTD defines which elements are allowed, their order, their attributes and their content.
- ▶ An XML document that conforms to a DTD is called valid.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

What is a DTD?

- ▶ A Document Type Definition (DTD) defines the structure of an XML document.
- ▶ The DTD defines which elements are allowed, their order, their attributes and their content.
- ▶ An XML document that conforms to a DTD is called valid.
- ▶ It is not required to use a DTD. An XML document without a reference to a DTD is not valid, but can still be a legal XML document as long as it is well-formed (obeys the general syntax rules).

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Why Use a DTD?

- ▶ With a DTD it is possible to **validate** the content of the XML document, thereby eliminating typos, forgotten tags and other syntactic mistakes.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Why Use a DTD?

- ▶ With a DTD it is possible to **validate** the content of the XML document, thereby eliminating typos, forgotten tags and other syntactic mistakes.
- ▶ A DTD can be used to **enforce correct format** when exchanging data.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Why Use a DTD?

- ▶ With a DTD it is possible to **validate** the content of the XML document, thereby eliminating typos, forgotten tags and other syntactic mistakes.
- ▶ A DTD can be used to **enforce correct format** when exchanging data.
- ▶ The DTD provides a description of the XML document.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

Defining a DTD

- ▶ The following DTD defines a tag set with the root element **book**, which has the nested elements **title**, **author** and **isbn**.

```
<!ELEMENT book (title,author,isbn)>  
<!ELEMENT title (#PCDATA)>  
<!ELEMENT author (#PCDATA)>  
<!ELEMENT isbn (#PCDATA)>
```

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

Defining a DTD

- ▶ The following DTD defines a tag set with the root element **book**, which has the nested elements **title**, **author** and **isbn**.

```
<!ELEMENT book (title,author,isbn)>
<!ELEMENT title (#PCDATA)>
<!ELEMENT author (#PCDATA)>
<!ELEMENT isbn (#PCDATA)>
```

- ▶ An XML document must refer to its DTD using the syntax
`<!DOCTYPE root-element SYSTEM "filename">`

```
<?xml version="1.0"?>
<!DOCTYPE book SYSTEM "book.dtd">
<book>
  <title>Web Development</title>
  <author>Olle Olsson</author>
  <isbn>0123456789</isbn>
</book>
```

XML

Standards

DTD Definitions

A DTD can contain the following definitions.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

DTD Definitions

A DTD can contain the following definitions.

ELEMENT An XML **element** and its content.

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

DTD Definitions

A DTD can contain the following definitions.

ELEMENT An XML **element** and its content.

ATTLIST An element's **attributes** and their content.

[XML](#)[Document Type Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML Standards](#)

DTD Definitions

A DTD can contain the following definitions.

ELEMENT An XML **element** and its content.

ATTLIST An element's **attributes** and their content.

PCDATA Parsed character data, character data is text between start and end tag of an XML element. Parsed character data is **interpreted by the XML parser**, for example **<name>** is interpreted as a XML tag.

[XML](#)[Document Type Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML Standards](#)

DTD Definitions

A DTD can contain the following definitions.

ELEMENT An XML **element** and its content.

ATTLIST An element's **attributes** and their content.

PCDATA Parsed character data, character data is text between start and end tag of an XML element. Parsed character data is **interpreted by the XML parser**, for example **<name>** is interpreted as a XML tag.

CDATA character data, will **not be parsed** by a parser.

[XML](#)[Document Type Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML Standards](#)

DTD Definitions

A DTD can contain the following definitions.

ELEMENT An XML **element** and its content.

ATTLIST An element's **attributes** and their content.

PCDATA Parsed character data, character data is text between start and end tag of an XML element. Parsed character data is **interpreted by the XML parser**, for example **<name>** is interpreted as a XML tag.

CDATA character data, will **not be parsed** by a parser.

ENTITIES Shortcuts to standard text or special characters.

[XML](#)[Document Type Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML Standards](#)

Element Definition

- ▶ An element declaration has one of the following syntaxes

```
<!ELEMENT element-name category>
```

```
<!ELEMENT element-name (element-content)>
```

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML

- ▶ Since XML elements are defined by the developer, there is a risk for **name conflicts**.

XML Namespaces

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ Since XML elements are defined by the developer, there is a risk for **name conflicts**.
- ▶ Therefore, it is necessary to use **namespaces**, just like we use packages in Java or namespaces in PHP.

Defining a Namespace

- ▶ A namespace is defined with the **xmlns** attribute.

```
<b:book xmlns:b="http:my.domain.se/books/">  
  <b:title>Web Development</b:title>  
  <b:author>Olle Olsson</b:author>  
  <b:isbn>0123456789</b:isbn>  
</b:book>
```

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

Defining a Namespace

- ▶ A namespace is defined with the **xmlns** attribute.

```
<b:book xmlns:b="http:my.domain.se/books/">  
  <b:title>Web Development</b:title>  
  <b:author>Olle Olsson</b:author>  
  <b:isbn>0123456789</b:isbn>  
</b:book>
```

- ▶ When using the **xmlns** attribute, we also specify a **prefix**, **b** in the example above.

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

Defining a Namespace

- ▶ A namespace is defined with the **xmlns** attribute.

```
<b:book xmlns:b="http:my.domain.se/books/">  
  <b:title>Web Development</b:title>  
  <b:author>Olle Olsson</b:author>  
  <b:isbn>0123456789</b:isbn>  
</b:book>
```

- ▶ When using the **xmlns** attribute, we also specify a **prefix**, **b** in the example above.
- ▶ All children to the element with the **xmlns** attribute, with the **defined prefix**, are associated with the **same namespace**.

Default Namespace

- ▶ If the prefix is omitted, the defined namespace becomes the **default namespace**, used for tags without prefix.

```
<book xmlns="http:my.domain.se/books/">  
  <title>Web Development</title>  
  <author>Olle Olsson</author>  
  <isbn>0123456789</isbn>  
</book>
```

- ▶ Each node in the document is handled once, there is **no way to reiterate**.
- ▶ No **random access**, nodes can only be read sequentially.
- ▶ It is **not possible to update** the document.
- ▶ There is **no formal specification** for SAX.

Standards

Other XML Standards

- ▶ So far we have seen DTD, Schema and DOM (and SAX, which is not a standard).
- ▶ There are many more useful standards for [handling XML documents](#).
- ▶ Here follows a very brief overview of some of them.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ XPath is a language for **finding information** in an XML document.

- ▶ XPath is a language for finding information in an XML document.
- ▶ An XPath expression has the same purpose as a CSS selector for an HTML document, though they do not have the same syntax.

- ▶ XPath is a language for finding information in an XML document.
- ▶ An XPath expression has the same purpose as a CSS selector for an HTML document, though they do not have the same syntax.
- ▶ Is based on path expressions.

XPath

- ▶ XPath is a language for **finding information** in an XML document.
- ▶ An XPath expression has the **same purpose as a CSS selector** for an HTML document, though they do not have the same syntax.
- ▶ Is based on **path expressions**.
- ▶ Contains **functions** for comparing and manipulating values in an XML document.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

XPath Example

- ▶ **Node** means any item in the document, element, attribute, text, etc

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

XPath Example

- ▶ **Node** means any item in the document, element, attribute, text, etc
- ▶ Select all item nodes that are children of the first order node that is a child of a orders node.

```
/orders/order[1]/item
```

[XML](#)[Document Type
Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML
Standards](#)

XPath Example

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

- ▶ **Node** means any item in the document, element, attribute, text, etc
- ▶ Select all item nodes that are children of the first order node that is a child of a orders node.

```
/orders/order[1]/item
```

- ▶ Select the text from cost nodes:

```
/orders/order/cost[text ()]
```

eXtensible Stylesheet Language Transformations, XSLT

- ▶ XSLT is a language for transforming an XML document into another XML document, for example into a XHTML document.

[XML](#)[Document Type Definition, DTD](#)[XML Namespaces](#)[XML Schema](#)[XML Processors](#)[Other XML Standards](#)

eXtensible Stylesheet Language Transformations, XSLT

- ▶ XSLT is a language for transforming an XML document into another XML document, for example into a XHTML document.
- ▶ An XSL style sheet consists of rules that are called templates.

Other XML
Standards

XSLT Example

Build a XHTML document to display the content of a XML document describing a music collection.

```
<xsl:template match="/">
  <html>
    <body>
      <h1>My Music Collection</h1>
      <table>
        <tr>
          <th>Title</th>
          <th>Artist</th>
        </tr>
        <xsl:for-each select="catalog/track">
          <xsl:sort select="artist"/>
          <tr>
            <td><xsl:value-of select="title"/></td>
            <td><xsl:value-of select="artist"/></td>
          </tr>
        </xsl:for-each>
      </table>
    </body>
  </html>
</xsl:template>
```

XML Schema

XML Processors

Other XML
Standards

XQuery

- ▶ XQuery is a **query language** for XML files.

XQuery

- ▶ XQuery is a query language for XML files.
- ▶ Used to extract elements and attributes from XML documents, like SQL **select** statements for relational databases.

XQuery

- ▶ XQuery is a **query language** for XML files.
- ▶ Used to **extract elements and attributes** from XML documents, like SQL **select** statements for relational databases.
- ▶ **Uses XPath** to find nodes.

XML

Document Type
Definition, DTD

XML Namespaces

XML Schema

XML Processors

Other XML
Standards

XQuery

- ▶ XQuery is a **query language** for XML files.
- ▶ Used to **extract elements and attributes** from XML documents, like SQL **select** statements for relational databases.
- ▶ **Uses XPath** to find nodes.
- ▶ Extract all order elements under the orders element that have a cost element with a value that is less than 30:

```
doc("orders.xml")/orders/order[cost<30]
```
