

DD2448 Foundations of Cryptography 7.5 hp Spring 2017

Important Source of Information

All information about the course is posted on the course homepage, https://www.kth.se/social/course/DD2448/.

Goal

The goal of the course is to

• give an overview of modern cryptography

in order that students should

- know how to evaluate and, to some extent, create cryptographic constructions, and
- to be able to read and to extract useful information from research papers in cryptography.

Prerequisites

DD1352 Algorithms, data structures and complexity (or DD2354 Algorithms and complexity for older students). We also assume knowledge of mathematics and theory of algorithms corresponding to the required courses of the D or F-programmes at KTH.

Lecturer

Douglas Wikström is responsible for the course and he gives most lectures. The safest way to reach him is by email at dog@kth.se (please put Krypto17 in the subject), but he can mostly be found in his office, Room 1518, Lindstedtsvägen 3 (5th floor in the E-building).

Tentative Plan of Content

- Administration, introduction, classical cryptography.
- Symmetric ciphers, substitution-permutation networks, linear cryptanalysis, differential cryptanalysis.
- AES, Feistel networks, Luby-Rackoff, DES, modes of operations, DES-variants.

- Entropy and perfect secrecy.
- Repetition of elementary number theory: groups, fields, and rings.
- Public-key cryptography, RSA, primality testing, textbook RSA, semantic security.
- RSA in ROM, Rabin, discrete logarithms, Diffie-Hellman, El Gamal.
- Security notions of hash functions, random oracles, iterated constructions, SHA, universal hash functions.
- Message authentication codes, identification schemes, signature schemes, PKI.
- Elliptic curve cryptography.
- Pseudorandom generators.
- Guest lecture.
- Make-up time and/or special topic.

Course Material

The main course book is Stinson: Cryptography, Theory and Practice, Chapman & Hall CRC, 3rd edition, but this book does not cover all of the material covered in class. Pointers to additional books and other literature are provided on the course homepage. Part of the course requirement is to find the necessary resources to learn more and solve problems. Thus, no reading instructions will be given.

Course Requirements

Know the Rules. All students are expected to have read and understood the *CSC code of honor*, but additional rules apply for this course. Both can be found at the course homepage. All students are required to read and understand the meaning of these rules before starting with any of the tasks below.

Group Project. The group project consists of several parts and is executed in groups of three, or

possibly four if the number of students is not divisible by three. Each part of the project give up to $20\ P$ points. Details on how the projects are graded are, or will be, available on the course homepage.

We expect students to organize themselves into groups in such a way that they contain both students that are comfortable with theory and with programming, since this will be needed to complete a group project. However, if this does not work, then we reserve the right to reassign students to groups to make them more balanced.

Homework I and II. Each homework consists of a number of assignments; both theoretical and practical. Solutions may be written in Swedish or English. Each assignment gives a number of *implementation* points (*I*-points) or *theory* points (*T*-points). Each homework satisfies $I + T \ge 100$. Detailed rules for how to solve and submit solutions to the homeworks are found on the course homepage.

Qualifying for the Oral Exam. A multiple choice exam on the contents of the course will take place during one of the lectures. The grade is pass or fail and a pass is required to take the oral exam.

Oral Exam. The oral exam is scheduled individually at the end of the course and gives a single oral point (*O*-point) if it is passed. The purpose of the oral exam is to give a more fair grade.

The starting point of the exam are the solutions to the homeworks submitted by the student and possibly also the group project. A number of (positive or negative) I, T, P-points may be awarded for individual problems of the homeworks for which written solutions have been submitted, depending on the level of understanding displayed. No more points can be withdrawn (negative points), than was awarded for a solution.

Thus, a moderate amount of remarking may take place, so make sure that you: (1) are ready to explain your solutions in detail at the exam, and (2) exploit this opportunity to improve your grade.

Deadlines. All the deadlines of the course are announced well in advance at the homepage.

Grading

The grade requirements are cumulative, e.g., to earn a C the requirements of the grades E-C must be fulfilled. Define the sum of *all* points by A = P + I + T + O. The requirements are as follows:

- **E.** $P \ge 30$, $I \ge 30$, $T \ge 40$, and $O \ge 1$.
- **D.** $A \ge 120$.
- **C.** P > 50 and A > 140.
- **B.** A > 170.
- **A.** $P \ge 60$ and $A \ge 210$.

A good group project is important!

Kattis

Kattis is a judging server for programming competitions and for grading programming assignments, see https://kth.kattis.com. We use this for all exercises where you submit code.

By default we assume that your Kattis id is the same as your KTH user name, e.g., if your KTH email is xyz@kth.se, then we assume that your Kattis user name is xyz. If that is not the case, then please email us your kattis user name using the subject Krypto17 Kattis, and don't forget to put your name in there as well.

Please ask a fellow student to give you a brief introduction to Kattis if you have not used it before.
