Part XIV

Maintainable Proofs

Motivation

Nice Properties of Proofs

- proofs are hopefully still used in a few weeks, months or even years
- often the environment changes slightly during the lifetime of a proof
 - ► your definitions change slightly
 - ▶ your own lemmata change (e.g. become more general)
 - ► used libraries change
 - ► HOL changed
 - ★ automation became more powerful
 - ★ rewrite rules in certain simpsets changed
 - \star definition packages produce slightly different theorems
 - ★ autogenerated variable-names change
 - ***** ...
- even if HOL and used libraries are stable, proofs often go through several iterations
- often they are adapted by someone else than the original author
- therefore it is important that proofs are easily maintainable

- maintainability is closely linked to other desirable properties of proofs
 - ► easily understandable
 - ► well-structured
 - ▶ robust
 - ★ they should be able to scope with minor changes to environment
 - ★ if they fail they should do so at sensible points
 - ▶ reusable
- How can one write proofs with such properties?
- \bullet as usual, there are no easy answers but plenty of good advice
- I recommend following the advice of **ProofStyle** manual

273 / 292 274 / 292

Formatting Example I

- format your proof such that it easily understandable
- make the structure of the proof very clear
- show clearly where subgoals start and stop
- use indentation to mark proofs of subgoals
- use empty lines to separate large proofs of subgoals
- use comments where appropriate

Bad Example Term Formatting

```
prove (''!11 12. 11 <> [] ==> LENGTH 12 <
LENGTH (11 ++ 12)'',
...)</pre>
```

Good Example Term Formatting

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'', ...)
```

275 / 292

276 / 292

Formatting Example II

Formatting Example II 2

Bad Example Subgoals

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >>
REWRITE_TAC[] >>
REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
REPEAT STRIP_TAC >>
DECIDE_TAC)
```

Good Example Subgoals

Make sure REWRITE_TAC is only applied to first subgoal and proof fails, if it does not solve this subgoal.

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >- (
   REWRITE_TAC[] >> )

REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
REPEAT STRIP_TAC >>
DECIDE_TAC)
```

Improved Example Subgoals

```
At least show when a subgoal starts and ends
```

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >> (
   REWRITE_TAC[]
) >>
REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
REPEAT STRIP_TAC >>
DECIDE TAC)
```

277 / 292 278 / 292

Formatting Example II 3

Some basic advice

Alternative Good Example Subgoals

```
Alternative good formatting using THENL
```

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >| [
    REWRITE_TAC[],

REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
    REPEAT STRIP_TAC >>
    DECIDE_TAC
])
```

Another Bad Example Subgoals

```
Bad formatting using THENL
```

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >| [REWRITE_TAC[],
REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
REPEAT STRIP_TAC >> DECIDE_TAC])
```

use semicoli after each declaration

- ▶ if exception is raised during interactive processing (e.g. by a failing proof), previous successful declarations are kept
- ▶ it sometimes leads to better error messages in case of parsing errors
- use plenty of parentheses to make structure very clear
- don't ignore parser warnings
 - especially multiple possible parse trees are likely to lead to unstable proofs
 - ▶ understand why such warnings occur and make sure there is no problem
- format your development well
 - use indentation
 - ▶ use linebreaks at sensible points
 - ► don't use overlong lines
 - ▶ ..
- don't use open in middle of files
- personal opinion: avoid unicode in source files

280 / 292

KISS and Premature Optimisation

279 / 292

Too much abstraction

- follow standard design principles
 - ► KISS principle
 - "premature optimization is the root of all evil" (Donald Knuth)
- don't try to be overly clever
- simple proofs are preferable
- proof-checking-speed mostly unimportant
- conciseness not a value in itself but desirable if it helps
 - ► readability
 - maintainability
- abstraction is often declarable, but also has a price
 - don't use too complex, artificial definitions and lemmata

Too much abstraction Example

```
val ABSTRACT_LEMMA = prove (''
!(size :'a -> num) (P : 'a -> bool) (combine : 'a -> 'a -> 'a).
   (!x. P x ==> (0 < size x)) /\
   (!x1 x2. size x1 + size x2 <= size (combine x1 x2)) ==>
   (!x1 x2. P x1 ==> (size x2 < size (combine x1 x2)))'',
   ...)

prove (''!11 12. l1 <> [] ==> (LENGTH l2 < LENGTH (l1 ++ l2))'',
   some proof using ABSTRACT_LEMMA
)</pre>
```

281 / 292

Too clever tactics

Too Clever Tactics Example I

- a common mistake is to use too clever tactics
 - ▶ intended to work on many (sub)goals
 - ▶ using TRY and other fancy trial and error mechanisms
 - ▶ intended to replace multiple simple, clear tactics
- typical case: a tactic containing TRY applied to many subgoals
- it is often hard to see why such tactics work
- if something goes wrong, they are hard to debug
- general advice: don't factor with tactics, instead use definitions and lemmata

Bad Example Subgoals

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >> (
   REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
   REPEAT STRIP_TAC >>
   DECIDE_TAC
))
```

Alternative Good Example Subgoals II

```
prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >> SIMP_TAC list_ss [])

prove (''!11 12. 11 <> [] ==> (LENGTH 12 < LENGTH (11 ++ 12))'',
Cases >| [
    REWRITE_TAC[],

REWRITE_TAC[listTheory.LENGTH, listTheory.LENGTH_APPEND] >>
    REPEAT STRIP_TAC >>
    DECIDE_TAC
])
```

284 / 292

Too Clever Tactics Example II

283 / 292

Too Clever Tactics Example II

Bad Example

```
val oadd_def = Define '(oadd (SOME n1) (SOME n2) = (SOME (n1 + n2))) /\
                       (oadd _
                                                 = NONE)';
val osub_def = Define '(osub (SOME n1) (SOME n2) = (SOME (n1 - n2))) /\
                                                 = NONE)';
val omul def = Define '(omul (SOME n1) (SOME n2) = (SOME (n1 * n2))) /\
                       (omul _
                                                 = NONE) :
val onum_NONE_TAC =
 Cases_on 'o1' >> Cases_on 'o2' >>
 SIMP_TAC std_ss [oadd_def, osub_def, omul_def];
val oadd_NULL = prove (
 ''!o1 o2. (oadd o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE) '',
 onum NONE TAC):
val osub_NULL = prove (
 ''!o1 o2. (osub o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE) '',
 onum NONE TAC):
val omul_NULL = prove (
 ''!o1 o2. (omul o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE)'',
 onum_NONE_TAC);
```

Good Example

```
val obin_def = Define '(obin op (SOME n1) (SOME n2) = (SOME (op n1 n2))) /\
                       (obin _
                                                    = NONE) :
val oadd_def = Define 'oadd = obin $+';
val osub_def = Define 'osub = obin $-';
val omul_def = Define 'omul = obin $*';
val obin_NULL = prove (
 ''!op o1 o2. (obin op o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE)'',
 Cases_on 'o1' >> Cases_on 'o2' >> SIMP_TAC std_ss [obin_def]);
val oadd_NULL = prove (
  ''!o1 o2. (oadd o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE)''.
 REWRITE_TAC[oadd_def, obin_NULL]);
val osub_NULL = prove (
 ''!o1 o2. (osub o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE)''.
 REWRITE_TAC[osub_def, obin_NULL]);
val omul_NULL = prove (
 ''!o1 o2. (omul o1 o2 = NONE) <=> (o1 = NONE) \/ (o2 = NONE) '',
 REWRITE TAC[omul def. obin NULL]):
```

285 / 292

Use many subgoals and lemmata

Subgoal Example

- often it is beneficial to use subgoals
 - ▶ they structure long proofs well
 - ▶ they help keeping the proof state clean
 - they mark clearly what one tries to proof and provide points where proofs can break sensibly
- general subgoals should often become lemmata
 - ► this improves reusability
 - proof scripts become shorter
 - proofs are disentangled

• the following example is taken from exercise 5

288 / 292

Subgoal Example II

Avoid Autogenerated Names

Autogenerated Names Example

- many HOL-tactics introduce new variable names
 - ► Induct
 - ► Cases
 - **•** . .
- the new names are often very artificial
- even worse, generated names might change in future
- proof scripts using autogenerated names are therefore
 - ► hard to read
 - ► potentially fragile
- therefore rename variables after they have been introduced
- HOL has multiple tactics supporting renaming
- most useful is rename1 'pat', it searches for pattern and renames vars accordingly

Bad Example

```
prove (''!1. 1 < LENGTH 1 ==> (?x1 x2 l'. l = x1::x2::l')'',
GEN_TAC >>
Cases_on 'l' >> SIMP_TAC list_ss [] >>
Cases_on 't' >> SIMP_TAC list_ss [])
```

Good Example

```
prove (''!1. 1 < LENGTH 1 ==> (?x1 x2 1'. 1 = x1::x2::1')'',
GEN_TAC >>
Cases_on '1' >> SIMP_TAC list_ss [] >>
rename1 'LENGTH 12' >>
Cases_on '12' >> SIMP_TAC list_ss [])
```

Proof State before rename1

```
1 < SUC (LENGTH t) ==> ?x2 1'. t = x2::1'
```

Proof State after rename1

```
1 < SUC (LENGTH 12) ==> ?x2 1'. 12 = x2::1'
```

291 / 292
