

## Lecture 9

Magnus Jansson, May 21, 2018

### Outline

- ▶ Matrix equations
- ▶ The Kronecker product
- ▶ Vectorization
- ▶ The Khatri-Rao product
- ▶ Differentiation

Parts of Chapter 4 in “Topics in Matrix Analysis,” by R. A. Horn and C. R. Johnson + additional material, see references on the last slide.

### Matrix Equations

Examples:

$$XA + A^*X = B$$

$$AX = B$$

$$AX = XA$$

$$AXB + CXD = E$$

$$AX + YB = C$$

$$X^2 = A$$

$$X^T AX + B^T X + X^T B = C$$

### The Kronecker product

Let  $A = [a_{ij}] \in M_{m,n}$  and  $B = [b_{ij}] \in M_{p,q}$ . The Kronecker product of  $A$  and  $B$  is defined as

$$A \otimes B \equiv \begin{bmatrix} a_{11}B & a_{12}B & \dots & a_{1n}B \\ a_{21}B & a_{22}B & \dots & a_{2n}B \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1}B & a_{m2}B & \dots & a_{mn}B \end{bmatrix} \in M_{mp,nq}$$

Notice that  $A \otimes B \neq B \otimes A$  in general.

The  $k$ th Kronecker power is defined as

$$A^{\otimes k} \equiv A \otimes A^{\otimes(k-1)}; \quad A^{\otimes 1} \equiv A$$

### Kronecker product: Some properties

For matrices  $A, B, C, D$  (of suitable dimensions) and scalar  $\alpha$  we have:

$$\begin{aligned}
(\alpha A) \otimes B &= A \otimes (\alpha B) = \alpha(A \otimes B) \\
(A \otimes B)^T &= A^T \otimes B^T \\
(A \otimes B)^* &= A^* \otimes B^* \\
(A \otimes B) \otimes C &= A \otimes (B \otimes C) \\
(A + B) \otimes C &= (A \otimes C) + (B \otimes C) \\
A \otimes (B + C) &= (A \otimes B) + (A \otimes C) \\
(A \otimes B)(C \otimes D) &= AC \otimes BD \\
(A \otimes B)^{-1} &= A^{-1} \otimes B^{-1}
\end{aligned}$$

if the inverses exist.

### The vec operator

Let  $A = [a_{ij}] \in M_{m,n}$ . Then the vector  $\text{vec}(A) \in \mathbf{C}^{mn}$  is defined as

$$\text{vec}(A) = [a_{11} \ a_{21} \ \dots \ a_{m1} \ a_{12} \ \dots \ a_{m2} \ \dots \ a_{1n} \ \dots \ a_{mn}]^T$$

### The vec operator: Properties

- ▶ It is simple to verify that

$$\begin{aligned}
\text{tr}(AB) &= \text{vec}^T(A^T) \text{vec}(B) \\
&= \text{vec}^T(B^T) \text{vec}(A) \\
&= \text{vec}^*(A^*) \text{vec}(B)
\end{aligned}$$

### The vec operator: Properties

- ▶ It is simple to verify that

$$\begin{aligned}
\text{tr}(AB) &= \text{vec}^T(A^T) \text{vec}(B) \\
&= \text{vec}^T(B^T) \text{vec}(A) \\
&= \text{vec}^*(A^*) \text{vec}(B)
\end{aligned}$$

- ▶ A very useful result is

$$\text{vec}(ABC) = (C^T \otimes A) \text{vec}(B)$$

for any matrices  $A, B, C$  of appropriate dimensions.

### Matrix equations, cont'd

$$\begin{aligned}
XA + A^*X = B &\Leftrightarrow [(A^T \otimes I) + (I \otimes A^*)] \text{vec}(X) = \text{vec}(B) \\
AX = B &\Leftrightarrow (I \otimes A) \text{vec}(X) = \text{vec}(B) \\
AX = XA &\Leftrightarrow [(I \otimes A) - (A^T \otimes I)] \text{vec}(X) = 0 \\
AXB + CXD = E &\Leftrightarrow [(B^T \otimes A) + (D^T \otimes C)] \text{vec}(X) = \text{vec}(E)
\end{aligned}$$

8 / 31

### Matrix equations, cont'd

More generally:

**Lemma:** Let  $T : M_{m,n} \rightarrow M_{p,q}$  be a given linear transformation. There exists a unique matrix  $K(T) \in M_{pq,mn}$  such that

$$\text{vec}(T(X)) = K(T) \text{vec}(X)$$

for all  $X \in M_{m,n}$ .

9 / 31

### Kronecker products: Further properties

**Thm:** Let  $A \in M_m$  and  $B \in M_n$ . If  $(\lambda, x)$  is an eigenvalue/eigenvector pair of  $A$  and similarly  $(\mu, y)$  an eigenvalue/vector pair of  $B$ , then  $\lambda\mu$  is an eigenvalue of  $A \otimes B$  with the corresponding eigenvector  $x \otimes y$ .

Furthermore, every eigenvalue arises in this way; that is, if  $\sigma(A) = \{\lambda_1, \dots, \lambda_m\}$  and  $\sigma(B) = \{\mu_1, \dots, \mu_n\}$ , then

$$\sigma(A \otimes B) = \{\lambda_i \mu_j : i = 1, 2, \dots, m; j = 1, 2, \dots, n\}$$

Notice also that  $\sigma(A \otimes B) = \sigma(B \otimes A)$ .

10 / 31

### Kronecker products: Further properties cont'd

**Cor:** If  $A \in M_m$  and  $B \in M_n$  are positive (semi)definite, then  $A \otimes B$  is also positive (semi)definite.

11 / 31

### Kronecker products: Further properties cont'd

**Cor:** If  $A \in M_m$  and  $B \in M_n$  are positive (semi)definite, then  $A \otimes B$  is also positive (semi)definite.

**Cor:** If  $A \in M_m$  and  $B \in M_n$ , then

$$\begin{aligned}\operatorname{tr}(A \otimes B) &= \operatorname{tr}(A) \operatorname{tr}(B) \\ \det(A \otimes B) &= \det(A)^n \det(B)^m\end{aligned}$$

11 / 31

### SVD and the Kronecker product

Let  $A \in M_{m,n}$  and  $B \in M_{p,q}$  have the singular value decompositions  $A = V_1 \Sigma_1 W_1^*$  and  $B = V_2 \Sigma_2 W_2^*$ , and assume  $\operatorname{rank}(A) = r_1$  and  $\operatorname{rank}(B) = r_2$ . Then

$$A \otimes B = (V_1 \otimes V_2)(\Sigma_1 \otimes \Sigma_2)(W_1 \otimes W_2)^*$$

The nonzero singular values of  $A \otimes B$  are the  $r_1 r_2$  positive numbers  $\{\sigma_i(A) \sigma_j(B) : i = 1, 2, \dots, r_1; j = 1, 2, \dots, r_2\}$ , where  $\sigma_i(A)$  is the  $i$ th singular value of  $A$  etc.. Hence,  $\operatorname{rank}(A \otimes B) = \operatorname{rank}(B \otimes A) = r_1 r_2$ .

12 / 31

### Permutation equivalences

A trivial but sometimes useful observation is that

$$\operatorname{vec}(A^T) = P(m, n) \operatorname{vec}(A) \quad \forall A \in M_{m,n}$$

where  $P(m, n) \in M_{mn}$  is a permutation matrix that only depends on the dimensions  $m$  and  $n$  ( $P(m, n) = P^T(n, m) = P^{-1}(n, m)$ ).

13 / 31

### Permutation equivalences

A trivial but sometimes useful observation is that

$$\operatorname{vec}(A^T) = P(m, n) \operatorname{vec}(A) \quad \forall A \in M_{m,n}$$

where  $P(m, n) \in M_{mn}$  is a permutation matrix that only depends on the dimensions  $m$  and  $n$  ( $P(m, n) = P^T(n, m) = P^{-1}(n, m)$ ).

From this it also follows that

$$B \otimes A = P^T(m, p)(A \otimes B)P(n, q)$$

for all  $A \in M_{m,n}$  and  $B \in M_{p,q}$ .

13 / 31

## Lyapunov equations and the Kronecker sum

Consider the matrix equation

$$AX + XB = C; \quad A \in M_n, B \in M_m, C, X \in M_{n,m}$$

or in Kronecker form

$$[(I_m \otimes A) + (B^T \otimes I_n)] \text{vec}(X) = \text{vec}(C)$$

14 / 31

## Lyapunov equations and the Kronecker sum

Consider the matrix equation

$$AX + XB = C; \quad A \in M_n, B \in M_m, C, X \in M_{n,m}$$

or in Kronecker form

$$[(I_m \otimes A) + (B^T \otimes I_n)] \text{vec}(X) = \text{vec}(C)$$

**Def:** The matrix

$$(I_m \otimes A) + (B \otimes I_n)$$

is called the Kronecker sum of  $A$  and  $B$ .

14 / 31

## Kronecker sum, cont'd

**Thm:** Let  $A \in M_n$  and  $B \in M_m$ . If  $(\lambda, x)$  is an eigenvalue/eigenvector pair of  $A$  and similarly  $(\mu, y)$  an eigenvalue/vector pair of  $B$ , then  $\lambda + \mu$  is an eigenvalue of the Kronecker sum

$$(I_m \otimes A) + (B \otimes I_n)$$

with the corresponding eigenvector  $y \otimes x$ . Every eigenvalue of the Kronecker sum arises in this way.

Notice also that  $I \otimes B$  and  $A \otimes I$  commute.

15 / 31

## Lyapunov equation, cont'd

Returning to the Lyapunov type equation

$$AX + XB = C \quad \Leftrightarrow \quad [(I_m \otimes A) + (B^T \otimes I_n)] \text{vec}(X) = \text{vec}(C)$$

According to the previous result, this equation has a unique solution  $X$  if and only if  $\lambda_i(A) + \mu_j(B) \neq 0$  for all  $i, j$  or equivalently  $\sigma(A) \cap \sigma(-B) = \emptyset$  (empty set).

16 / 31

### Lyapunov equation, cont'd

Returning to the Lyapunov type equation

$$AX + XB = C \iff [(I_m \otimes A) + (B^T \otimes I_n)] \text{vec}(X) = \text{vec}(C)$$

According to the previous result, this equation has a unique solution  $X$  if and only if  $\lambda_i(A) + \mu_j(B) \neq 0$  for all  $i, j$  or equivalently  $\sigma(A) \cap \sigma(-B) = \emptyset$  (empty set).

In the complex valued case we had the Lyapunov equation

$$XA + A^*X = C$$

It has a unique solution  $X$  if and only if  $\sigma(-A^*) \cap \sigma(A) = \emptyset$  or  $\overline{\sigma(-A)} \cap \sigma(A) = \emptyset$ . This condition is certainly satisfied when  $A$  is stable (positive or negative).

### The Khatri-Rao product

The Khatri-Rao product of  $A \in M_{m,n}$  and  $B \in M_{p,n}$  is defined as (the symbol may differ)

$$A \odot B = [a_1 \otimes b_1 \ a_2 \otimes b_2 \ \dots \ a_n \otimes b_n]$$

where  $a_i, b_j$  denote the  $i$ th column in  $A$  and  $B$ , respectively.

### The Khatri-Rao product

The Khatri-Rao product of  $A \in M_{m,n}$  and  $B \in M_{p,n}$  is defined as (the symbol may differ)

$$A \odot B = [a_1 \otimes b_1 \ a_2 \otimes b_2 \ \dots \ a_n \otimes b_n]$$

where  $a_i, b_j$  denote the  $i$ th column in  $A$  and  $B$ , respectively.

It is useful, for example, in matrix equations in which diagonal matrices are involved. Let  $A, B, C$  be matrices of appropriate dimensions and let  $B$  be a diagonal matrix. Then

$$\text{vec}(ABC) = (C^T \otimes A) \text{vec}(B) = (C^T \odot A) \text{diag}(B)$$

where  $\text{diag}(B)$  denotes the column vector of the diagonal elements of  $B$ .

### The Hadamard product

Let  $A = [a_{ij}] \in M_{m,n}$  and  $B = [b_{ij}] \in M_{m,n}$ . The Hadamard or Schur product of  $A$  and  $B$  is defined as

$$A \circ B \equiv [a_{ij}b_{ij}] \in M_{m,n}$$

More information and properties in Chapter 5 in "Topics in Matrix Analysis."

### Derivatives: Some definitions

The derivative of a matrix  $A(t) = [a_{ij}(t)]$  that depends on a (real) scalar  $t$  is defined as the matrix

$$\frac{dA(t)}{dt} = \left[ \frac{da_{ij}(t)}{dt} \right]$$

### Derivatives: Some definitions

We can also define the derivative of a vector  $y \in \mathbf{R}^m$  with respect to a vector  $x \in \mathbf{R}^n$  as follows

$$\frac{\partial y}{\partial x} = \begin{bmatrix} \frac{\partial y_1}{\partial x_1} & \frac{\partial y_1}{\partial x_2} & \dots & \frac{\partial y_1}{\partial x_n} \\ \frac{\partial y_2}{\partial x_1} & \frac{\partial y_2}{\partial x_2} & \dots & \frac{\partial y_2}{\partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial y_m}{\partial x_1} & \frac{\partial y_m}{\partial x_2} & \dots & \frac{\partial y_m}{\partial x_n} \end{bmatrix}$$

(Please notice that other definitions are often used!)

### Derivatives, cont'd

Clearly, if  $y$  is a scalar we get

$$\frac{\partial y}{\partial x} = \begin{bmatrix} \frac{\partial y}{\partial x_1} \\ \frac{\partial y}{\partial x_2} \\ \vdots \\ \frac{\partial y}{\partial x_n} \end{bmatrix}$$

or when  $x$  is a scalar

$$\frac{\partial y}{\partial x} = \left[ \frac{\partial y_1}{\partial x} \quad \frac{\partial y_2}{\partial x} \quad \dots \quad \frac{\partial y_m}{\partial x} \right]$$

### Derivatives; simple results

Let  $x \in \mathbf{R}^n$  and  $A$  a matrix independent of  $x$ .

$$\frac{\partial Ax}{\partial x} = A^T$$

$$\frac{\partial x^T A}{\partial x} = A$$

$$\frac{\partial x^T x}{\partial x} = 2x$$

$$\frac{\partial x^T A x}{\partial x} = (A + A^T)x \quad (= 2Ax \text{ if } A \text{ is symmetric})$$

$$\frac{\partial}{\partial x} \left[ \frac{\partial x^T A x}{\partial x} \right] = (A + A^T) \quad (= 2A \text{ if } A \text{ is symmetric})$$

### Chain rule for vectors

Assume  $z[y(x)]$  where  $x, y, z$  are real vectors, then:

$$\frac{\partial z}{\partial x} = \frac{\partial y}{\partial x} \frac{\partial z}{\partial y}$$

### Derivative of scalars with respect to a matrix

Let  $X = [x_{ij}] \in M_{m,n}(\mathbf{R})$  and let  $y = f(X)$  be a real valued scalar function of  $X$ .

Then we define

$$\frac{\partial y}{\partial X} = \begin{bmatrix} \frac{\partial y}{\partial x_{11}} & \frac{\partial y}{\partial x_{12}} & \dots & \frac{\partial y}{\partial x_{1n}} \\ \frac{\partial y}{\partial x_{21}} & \frac{\partial y}{\partial x_{22}} & \dots & \frac{\partial y}{\partial x_{2n}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial y}{\partial x_{m1}} & \frac{\partial y}{\partial x_{m2}} & \dots & \frac{\partial y}{\partial x_{mn}} \end{bmatrix} = \left[ \frac{\partial y}{\partial x_{ij}} \right] = \sum_{i,j} E_{ij} \frac{\partial y}{\partial x_{ij}}$$

where  $E_{ij} \in M_{m,n}$  is an elementary matrix with a 1 in the  $ij$ th position and zeros elsewhere.

### Derivative of trace

Let  $X \in M_n(\mathbf{R})$  :

$$\frac{\partial \text{tr}(X)}{\partial X} = I$$

### Derivative of determinant

Let  $Y, X$  be square matrices:

$$\frac{\partial \det(Y(X))}{\partial X} = ?$$

**Derivation:** Notice first that

$$\det(Y) = \sum_r y_{rs} c_{rs}$$

where  $c_{rs}$  is the cofactor of  $y_{rs}$ .

$$\begin{aligned} \frac{\partial \det(Y(X))}{\partial x_{ij}} &= \sum_{r,s} \frac{\partial \det(Y(X))}{\partial y_{rs}} \frac{\partial y_{rs}}{\partial x_{ij}} \\ &= \sum_{r,s} c_{rs} \frac{\partial y_{rs}}{\partial x_{ij}} = \text{tr}(\text{Adj}(Y) \frac{\partial Y}{\partial x_{ij}}) \end{aligned}$$

### Derivative of log det

Let  $Y(X)$  be positive definite and recall  $Y^{-1} = \text{Adj}(Y) / \det(Y)$ .

From the above, we get

$$\begin{aligned} \frac{\partial \log \det(Y(X))}{\partial x_{ij}} &= \frac{1}{\det(Y(X))} \frac{\partial \det(Y(X))}{\partial x_{ij}} \\ &= \frac{1}{\det(Y)} \text{tr} \left( \text{Adj}(Y) \frac{\partial Y}{\partial x_{ij}} \right) \\ &= \text{tr} \left( Y^{-1} \frac{\partial Y}{\partial x_{ij}} \right) \end{aligned}$$

Other simple results for matrix expressions wrt elements:

$$\begin{aligned} \frac{\partial AXB}{\partial x_{ij}} &= AE_{ij}B \\ \frac{\partial AX^{-1}B}{\partial x_{ij}} &= -AX^{-1}E_{ij}X^{-1}B \end{aligned}$$

### Derivatives of matrices with respect to matrices

Some different possibilities:

$$\begin{aligned} \frac{\partial Y}{\partial X} &= \text{a partitioned matrix with } ij\text{th block } \frac{\partial Y}{\partial x_{ij}} \\ \frac{\partial Y}{\partial X} &= \text{a partitioned matrix with } ij\text{th block } \frac{\partial y_{ij}}{\partial X} \\ \frac{\partial Y}{\partial X} &= \frac{\partial \text{vec}(Y)}{\partial \text{vec}(X)} \end{aligned}$$

### Second derivatives

The second derivative of a scalar function of a vector is a matrix called the Hessian and is defined as

$$\frac{\partial^2 f(x)}{\partial x \partial x^T} = \begin{bmatrix} \frac{\partial^2 f(x)}{\partial x_1 \partial x_1} & \frac{\partial^2 f(x)}{\partial x_1 \partial x_2} & \dots & \frac{\partial^2 f(x)}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f(x)}{\partial x_2 \partial x_1} & \frac{\partial^2 f(x)}{\partial x_2 \partial x_2} & \dots & \frac{\partial^2 f(x)}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial^2 f(x)}{\partial x_n \partial x_1} & \frac{\partial^2 f(x)}{\partial x_n \partial x_2} & \dots & \frac{\partial^2 f(x)}{\partial x_n \partial x_n} \end{bmatrix}$$
