## What is Nuclear Chemistry?

- Chemistry related to nuclear technology
- Chemistry of radionuclides
- Studies of chemical processes by using radionuclides as tracers: Radiochemistry
- Radiation induced chemical reactions:

Radiation Chemistry

## The Nucleus

- Building blocks: Protons and neutrons
- Forces: Electromagnetic forces and the Strong Nuclear Force

| Property | Proton | Neutron |
| :--- | :---: | :---: |
| Mass | $1.673 \times 10^{-24} \mathrm{~g}$ | $1.675 \times 10^{-24} \mathrm{~g}$ |
| Charge | +1 | 0 |
| Spin | $\mathrm{s}=1 / 2$ | $\mathrm{~s}=1 / 2$ |

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

The (Strong) Nuclear Force
Exchange of mesons keep the nucleons together $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Nuclear density and radius

Radial distance, $10^{-15} \mathrm{~m}$
Measured charge and nuclear density for ${ }^{40} \mathrm{Ca}$ and ${ }^{209} \mathrm{Bi}$
as a function of nuclear radius

Number of Nucleons on the Stability of the Nuclei

Magic numbers of protons or neutrons: 2, 8, 20, 50, 82 and 126
${ }_{54}^{135} \mathrm{Xe} \quad\left(\sigma_{\mathrm{n}}=2.6 \times 10^{6}\right.$ barns $) \mathrm{N}=81$
${ }_{54}^{136} \mathrm{Xe}\left(\sigma_{\mathrm{n}}=0.28\right.$ barns $) \quad \mathrm{N}=82$
Nuclear Stability: Nucleon Orbitals
UNSTABLE
$\qquad$

Mass Defect ( $\Delta M$ ) and Mass Excess $\left(\delta_{A}\right)$
$\Delta M_{A}=M_{A}-Z M_{p}-N M_{n}$
$M_{A}=$ Mass of atom
$M_{H}=$ Mass of Proton (hydrogen)
$M_{n}=$ Mass of Neutron
Deuterium,
$M_{p}+M_{n}=1.007825+1.008665$
${ }_{1}^{2} \mathrm{H}=2.016490 \mathrm{u}$
$M_{A}=2.014102 u$
$\Rightarrow \Delta M_{A}=-0.002388 u$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

All stable isotopes have negative mass defect, $\Delta \mathrm{M}_{\mathrm{A}}$

Mass excess: $\delta_{A}=M_{A}-A$
(sometimes used in tables, no practical use)
$\mathrm{M}=$ atomic mass unit, measured in u

## Binding energy

$\Delta E=\Delta \mathrm{mc}^{2} \quad$ "Nuclear Heat of formation"

| $\Delta m=M_{A}-\left(\mathrm{Z} \mathrm{m}_{\mathrm{p}}+N \mathrm{~m}_{n}\right)$ |
| :--- |
| $c=3 \times 10^{8} \mathrm{~m} / \mathrm{s}$ |

Nucleus: $5-10 \mathrm{MeV} /$ nucleon $\left(5-10 \times 10^{11} \mathrm{~J} / \mathrm{mol}\right)$
Covalent bond: $4.4 \times 10^{5} \mathrm{~J} / \mathrm{mol}$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Isotope effects

Due to the difference in nucleons there are very small differences between two isotope's

- Freezing point
- Boiling point
- Density
- Heat of vaporization
- Viscosity
- Surface tension
- Optical emission spectra

## Isotope effects

Replacing ${ }^{1} \mathrm{H}$ with D (deuterium, ${ }^{2} \mathrm{H}$ ) increases the mass $100 \%$
Replacing ${ }^{12} \mathrm{C}$ with ${ }^{13} \mathrm{C}$ increases the mass $8 \%$ $\qquad$
$\qquad$
A reaction involving C-H bond is typically 6-10 times faster than that for a C-D bond
$>$ A reaction involving ${ }^{12} \mathrm{C}-\mathrm{H}$ bond is 1.04 times faster than $\qquad$ that for a ${ }^{13} \mathrm{C}-\mathrm{H}$ bond

## Isotope separation

i. Equilibrium processes (light elements)
ii. Rate processes

Multi-stage processes (for instance distillation)
Chemical exchange
Electrolysis
Gaseous diffusion
Electromagnetic separation
Gas centrifugation

## Gaseous diffusion

Lighter isotopes diffuse faster than heavy isotopes
$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Other methods of isotope separation

$\qquad$

Distillation
Extraction
$\qquad$
$\qquad$
lon-exchange
Photoionization
Photoexcitation $\qquad$
$\qquad$
$\qquad$

Radioactive decay
$\alpha$-decay (He-nucleus)
$\qquad$
$\beta$-decay (electron/positron) $\qquad$
$\gamma$-decay
Unusual modes of decay (proton, neutron, heavy particles)
Spontaneous fission

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
${ }^{240} \mathrm{Pu} \rightarrow{ }^{236} \mathrm{U}$

## Conservation laws

Nuclear Reaction: $X_{1}+X_{2} \rightarrow X_{3}+X_{4}$

Energy (mass): $\mathrm{E}_{1}+\mathrm{E}_{2}=\mathrm{E}_{3}+\mathrm{E}_{4}$

Linear momentum: $\mathrm{p}=\mathrm{mv}$
$p_{1}+p_{2}=p_{3}+p_{4}$
Charge: $Z_{1}+Z_{2}=Z_{3}+Z_{4}$
Mass number: $\mathrm{A}_{1}+\mathrm{A}_{2}=\mathrm{A}_{3}+\mathrm{A}_{4}$

## $\alpha$-decay

$$
{ }_{z}^{A} X \rightarrow{ }_{Z-2}^{A-4} Y+{ }_{2}^{4} \mathrm{He}
$$

${ }^{238} \mathrm{U} \rightarrow{ }^{234} \mathrm{Th}+{ }^{4} \mathrm{He}$
${ }^{238} \mathrm{U} \rightarrow{ }^{234} \mathrm{Th}+\alpha$

## Decay energy (Q-value)

## E=mc ${ }^{2}$

$1 \mathrm{u}=1 / 6.022 \times 10^{23}=1.66 \times 10^{-24} \mathrm{~g}$
$\mathrm{c}^{2}=8.99 \times 10^{16} \mathrm{~m}^{2} / \mathrm{s}^{2}$
$1 \mathrm{~J}=6.24 \times 10^{12} \mathrm{MeV}$
$\mathrm{E}=1.66 \times 10^{-24} * 8.99 \times 10^{16} * 6.24 \times 10^{12}=931.5 \mathrm{MeV} / \mathrm{u}$ $\qquad$
$Q(\mathrm{MeV})=-931.5 \Delta \mathrm{M}(\mathrm{u})$
$Q_{\alpha}=-931.5\left(M_{\mathrm{Z}-2}+\mathrm{M}_{\mathrm{He}}-\mathrm{M}_{\mathrm{Z}}\right)$
$Q_{\alpha}>0$ if $\left(M_{Z-2}+M_{H e}-M_{z}\right)<0$
$\mathrm{Q}_{\alpha}>0=>$ Spontaneous decay
For $\alpha$-particles the $Q$-value is $2-10 \mathrm{MeV}$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## $\beta$-decay: Two types of $\beta$-decay

$\qquad$
$\qquad$
${ }_{Z}^{A} X \rightarrow{ }_{Z+1}^{A} Y+\beta^{-} \quad \begin{aligned} & \text { A negatron (electron) is emitted } \\ & \text { A nevurtron in the nucleus is } \\ & \text { conered to a p roton }\end{aligned}$

A positron (anti-particle to the

$\qquad$
$\qquad$
$\qquad$

## $\beta$-decay

$$
{ }^{137} \mathrm{Cs} \rightarrow{ }^{137 \mathrm{mBa}+\beta^{-}}
$$

$\qquad$

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## $\beta$-decay continued

$\qquad$
$\Rightarrow$ Another particle is emitted: a neutrino (v) $\qquad$
The neutrino has no charge and very small or no mass and does not interact readily with matter

$$
{ }^{137} \mathrm{Cs} \rightarrow{ }^{137 \mathrm{mBa}+\beta^{-}+\bar{v}}
$$

$v$ is an anti-neutrino, emitted in a $\beta^{-}$-decay
$\qquad$
$\bar{v}$ is a neutrino, emitted in a $\beta^{+}$-decay $\qquad$
$\qquad$

Energy of $\beta^{-}$decay

${ }_{\mathrm{Z}}^{\mathrm{A}} \mathrm{X} \rightarrow{ }_{\mathrm{Z}+1}^{\mathrm{A}} \mathrm{Y}+\beta^{-}+\bar{v}$
The formed $Y$ has $Z$ orbit electrons and must capture one electron from the surroundings.
=> The mass of the $\beta^{-}$-particle shall thus not to be included when calculating the energy of the decay.
$Q_{\beta^{-}}=-931.513\left(M_{Z+1}-M_{z}\right)$
Example: $\boldsymbol{n} \rightarrow \mathrm{H}+\boldsymbol{\beta}^{-}$
$Q_{\beta^{-}}=-931.513(1.007825-1.008665)=0,782 \mathrm{MeV}$

## Energy of $\boldsymbol{\beta}^{+}$decay

${ }_{\mathrm{z}}^{\mathrm{A}} \mathrm{X} \rightarrow{ }_{\mathrm{z}-1}^{\mathrm{A}} \mathrm{Y}^{-}+\beta^{+}+v \rightarrow{ }_{\mathrm{z-1}}{ }^{\mathrm{A}} \mathrm{Y}+\mathrm{e}^{-}+\beta^{+}+v$ $\qquad$

The formed Y has now one extra orbit electron which it must loose.
=> Both emitting a $\beta^{+}$-particle and loosing an electron must be included when calculating the energy of the decay.
$Q_{\beta^{-}}=-931.513\left(M_{z-1}+2 M_{e}-M_{z}\right)$
Example: ${ }_{7}^{13} \mathrm{~N} \rightarrow{ }_{6}^{13} \mathrm{C}+\beta^{+}$
$\left.Q_{\beta^{-}}=-931.513(13.003355-13.005739)+2^{\star} 0.511\right)=1,2 \mathrm{MeV}$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Electron capture

${ }_{Z}^{A} \mathrm{X} \xrightarrow{\mathrm{EC}}{ }_{Z-1}^{\mathrm{A}} \mathrm{Y}+V$
An inner shell electron is captured by the nucleus.
Energy similar to $\beta$ - decay.
$Q_{\beta}=-.931 .513\left(M_{21}-M_{2}\right)$

## $\gamma$-emisson

Most $\alpha$ and $\beta$-decays do not go all the way to the $\qquad$
daughter's ground state.
The remaining energy is released as $\gamma$-rays. $\qquad$

## Isomeric transition

$\qquad$
When the meta-stable state is more long-lived $\qquad$
$\qquad$
$\qquad$

## Spontaneous fission

Some heavy radionuclides are so unstable that they
$\qquad$ undergo spontaneous fission

## Rare modes of decay

$\qquad$

Proton emission
Neutron emission
Emission of heavy particles

## Gamma spectrum

$\qquad$

GAMMA ENERGY (keV)

## Rate of a radioactive decay

$\qquad$

$$
\mathrm{N} \rightarrow \text { Daughter + particle }
$$

$\qquad$
First order rate reaction: $\quad A=-\frac{d N}{d t}=\lambda N$
$-\frac{d c}{d t}=k c$ $\qquad$
$-\frac{d N}{N}=\lambda d t$

$$
\begin{gathered}
-\int_{N_{0}}^{N} \frac{1}{N} d N=\int_{0}^{t} \lambda d t \Rightarrow \ln N-\ln N_{0}=-\lambda t \\
N=N_{0} e^{-\lambda t}
\end{gathered}
$$

## Half-life

$-\int_{N_{0}}^{N} \frac{1}{N} d N=\int_{0}^{t_{1 / 2}} \lambda d t \Rightarrow \ln N-\ln N_{0}=-\lambda t_{1 / 2}$

$$
\begin{gathered}
N=\frac{N_{0}}{2} \\
t_{1 / 2}=\frac{\ln N_{0}-\ln \left(\frac{N_{0}}{2}\right)}{\lambda}=\frac{\ln 2}{\lambda}
\end{gathered}
$$

## Units

SI unit:
1 Becquerel $(\mathrm{Bq})=1$ decay $/ \mathrm{s}$
Older unit:
1 Curie $(\mathrm{Ci})=3.7 \times 10^{10} \mathrm{~Bq}$
(1 Ci is approximately the actvity of 1 gram ${ }^{226} \mathrm{Ra}$ )
