## GAUSS'S THEOREM and STOKES'S THEOREM

Kapitel 6-7  
Sidor 51-82

# TARGET PROBLEM

ELECTRIC FIELD

MAGNETIC FIELD

**Magnetic monopoles do not exist in nature.  
What this implies, in terms of the magnetic field  $\vec{B}$  ?**

# TARGET PROBLEM

Let's consider some ELECTRIC CHARGES

and two closed surfaces,  $S_1$  and  $S_2$

$S_1$  does not contain any charge.  
It has no sources and no sinks:  
no field lines destroyed and  
no field lines created inside  $S_1$

$$\iint_{S_1} \vec{E} \cdot d\vec{S} = 0$$

$S_2$  do contain a charge.

It has a sink. Field lines are destroyed inside  $S_2$

$$\iint_{S_2} \vec{E} \cdot d\vec{S} \neq 0$$

To calculate this integral we need:

- to introduce the divergence of a vector field  $\vec{A}$ ,  $\text{div } \vec{A}$
- the Gauss's theorem  $\iint_S \vec{A} \cdot d\vec{S} = \iiint_V \text{div} \vec{A} dV$

# THE DIVERGENCE

In cartesian coordinates, the divergence of a vector field  $\vec{A}$  is:

$$\text{div} \vec{A} \equiv \frac{\partial A_x}{\partial x} + \frac{\partial A_y}{\partial y} + \frac{\partial A_z}{\partial z} \quad (1)$$

## DEFINITION

It is a measure of **how much the field diverges (or converges) from (to) a point.**

Let's suppose that  $\vec{A}$  is the velocity field of the water in a pool

Let's make a hole in the pool...

Far from the hole, the velocity is almost constant.  
The divergence is almost zero.

Close to the hole the velocity is changing a lot.  
The divergence is high.

If there is no hole  $\Rightarrow \text{div} \vec{A} = 0$   
(and no source...)  $\Downarrow$

**The divergence is also a measure of sources or sinks**

# THE GAUSS'S THEOREM

$$\iint_S \vec{A} \cdot d\vec{S} = \iiint_V \text{div} \vec{A} dV$$

(2)

where **S is a closed surface** that forms the boundary of the volume  $V$  and  $\vec{A}$  is a continuously differentiable vector field defined on  $V$ .

# THE GAUSS'S THEOREM

PROOF

$$\begin{aligned} \iiint_V \operatorname{div} \vec{A} dV &= \iiint_V \left( \frac{\partial A_x}{\partial x} + \frac{\partial A_y}{\partial y} + \frac{\partial A_z}{\partial z} \right) dxdydz = \\ &= \iiint_V \frac{\partial A_x}{\partial x} dxdydz + \iiint_V \frac{\partial A_y}{\partial y} dxdydz + \iiint_V \frac{\partial A_z}{\partial z} dxdydz \end{aligned}$$

Let's calculate the last term:

$$\iiint_V \frac{\partial A_z}{\partial z} dxdydz = \iint_{S_p} dxdy \int_{f_1(x,y)}^{f_2(x,y)} \frac{\partial A_z}{\partial z} dz = \iint_{S_p} [A_z(x, y, f_2(x, y)) - A_z(x, y, f_1(x, y))] dxdy =$$

$dxdy$  is the projection on  $S_p$  of the small element surfaces on  $dS_1$  and  $dS_2$ .

Therefore:  $dxdy = -\hat{e}_z \cdot \hat{n}_1 dS_1 = \hat{e}_z \cdot \hat{n}_2 dS_2$

$$= \iint_{S_2} A_z(x, y, f_2(x, y)) \hat{e}_z \cdot \hat{n}_2 dS_2 + \iint_{S_1} A_z(x, y, f_1(x, y)) \hat{e}_z \cdot \hat{n}_1 dS_1 = \iint_S A_z \hat{e}_z \cdot \hat{n} dS$$

Which means:

$$\iiint_V \frac{\partial A_z}{\partial z} dV = \iint_S A_z \hat{e}_z \cdot \hat{n} dS \quad (3)$$

# THE GAUSS'S THEOREM

## PROOF

In the same way we get:

$$\iiint_V \frac{\partial A_x}{\partial x} dV = \iint_S A_x \hat{e}_x \cdot \hat{n} dS \quad (4)$$

$$\iiint_V \frac{\partial A_y}{\partial y} dV = \iint_S A_y \hat{e}_y \cdot \hat{n} dS \quad (5)$$

Adding together equations (3), (4) and (5) we finally obtain:

$$\begin{aligned} \iiint_V \operatorname{div} \vec{A} dV &= \iiint_V \frac{\partial A_x}{\partial x} dxdydz + \iiint_V \frac{\partial A_y}{\partial y} dxdydz + \iiint_V \frac{\partial A_z}{\partial z} dxdydz = \\ &= \iint_S A_x \hat{e}_x \cdot \hat{n} dS + \iint_S A_y \hat{e}_y \cdot \hat{n} dS + \iint_S A_z \hat{e}_z \cdot \hat{n} dS = \iint_S \vec{A} \cdot d\vec{S} \end{aligned}$$

# THE GAUSS'S THEOREM

## PROOF

What if we consider a more complicated volume?

We divide the volume  $V$  in smaller and “simpler” volumes

$$V = V_1 + V_2 + \dots = \sum_i V_i$$

$$\iiint_V \text{div} A dV = \sum_i \iiint_{V_i} \text{div} A dV =$$

$$\sum_i \iint_{S_i} A \cdot dS = \iint_S A \cdot dS$$

## GAUSS'S THEOREM.

### Logic steps for the proof

- 1- Consider a closed surface.
- 2- Divide the surface in two parts, an upper surface and a lower surface and consider an infinitesimal surface element  $dS_1$  on the upper surface.
- 3- Consider the projection of the surface element on the xy plane, it will be  $dx dy$ . The projection will identify a infinitesimal surface element ( $dS_2$ ) on the lower surface.
- 4- Write the expression that relates  $dx dy$  to  $dS_1$  and  $dS_2$ .
- 5- Write down the volume integral of  $\overline{\text{div} A}$
- 6- Split the volume integral into three terms.
  - 6.1- Consider only the term which depends on the z-derivative of  $A_z$ .
  - 6.2- Remove the z-derivative by solving the integral in  $dz$ .

What will remain is just the integral in  $dx dy$ .
  - 6.3- Express  $dx dy$  in order to obtain  $dS_1$  and  $dS_2$ .
  - 6.4- Re-arrange the integrals in  $dS_1$  and  $dS_2$  in order to have obtain a flux integral of  $(0,0,A_z)$ .
- 7- Repeat the same for the terms which depend on the x-derivative of  $A_x$  and on the y-derivative of  $A_y$ .
- 8- Add all the three terms together in order to obtain the flux of  $\overline{A}$ .

# PHYSICAL INTERPRETATION

Suppose that  $\vec{v}(\vec{r})$  is the velocity field of a fluid (homogeneous and incompressible)

Let's apply the Gauss' theorem to a volume  $V$  of the fluid

$$\oiint_S \vec{v} \cdot d\vec{S} = \iiint_V \text{div}(\vec{v}) dV$$

It is the fluid volume per second [ $\text{m}^3/\text{s}$ ] that moves out (*in*) from the closed surface  $S$

If there are no sinks and no sources, then no fluid enters in  $S$

And no fluid flows out from  $S$ .

This implies that the flow  $\oiint_S \vec{v} \cdot d\vec{S}$  is zero. Therefore,  $\text{div}(\vec{v}) = 0$

$\text{div}(\vec{v}) = 0 \Rightarrow$  No sink and no source

$\text{div}(\vec{v}) < 0 \Rightarrow$  flux is destroyed  
and there is a sink

$\text{div}(\vec{v}) > 0 \Rightarrow$  flux is created  
and there is a source

# TARGET PROBLEM

**Magnetic monopoles do not exist in nature.  
What this implies, in terms of the magnetic field  $\mathbf{B}$ ?**

Magnetic monopoles do not exist  $\Rightarrow$  the flux of  $\mathbf{B}$  is zero

Let's apply the Gauss's theorem to the magnetic field:

Gauss

$$\left\{ \begin{array}{l} \iint_S \bar{\mathbf{B}} \cdot d\bar{\mathbf{S}} = \iiint_V \text{div} \bar{\mathbf{B}} dV \\ \iint_S \bar{\mathbf{B}} \cdot d\bar{\mathbf{S}} = 0 \end{array} \right. \quad \text{div} \bar{\mathbf{B}} = 0$$

Exercise: apply the Gauss's theorem

to the Gauss's law:  $\iint \bar{\mathbf{E}} \cdot d\bar{\mathbf{S}} = \frac{Q}{\epsilon_0}$

*One of the four  
Maxwell's  
equations*

# WHICH STATEMENT IS WRONG?

- 1- The divergence of a vector field is a scalar (yellow)
- 2- The divergence is related to a measurement of the flux (red)
- 3- The Gauss' theorem translates a surface integral into a volume integral (green)
- 4- The Gauss' theorem can be applied also to a non closed surface (blue)

# VEKTORANALYS

## STOKES'S THEOREM

# TARGET PROBLEM

- The current  $\vec{I}$  is flowing in a conductor
- How to calculate the magnetic field?

We need:

- Definition of the “curl” (or rotor) of a vector field

$$\text{rot } \vec{A}$$

- The **Stokes' theorem**

$$\oint_L \vec{A} \cdot d\vec{r} = \iint_S \text{rot } \vec{A} \cdot d\vec{S}$$

- A law that relates the current with the magnetic field:  
the fourth Maxwell's equation (with static electric field):  $\text{rot } \vec{B} = \mu_0 \vec{j}$

# THE CURL

$\overline{rot A}$

DEFINITION (in cartesian coordinate)

$$\overline{rot A} = \begin{vmatrix} \hat{e}_x & \hat{e}_y & \hat{e}_z \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ A_x & A_y & A_z \end{vmatrix} = \left( \frac{\partial A_z}{\partial y} - \frac{\partial A_y}{\partial z}, \frac{\partial A_x}{\partial z} - \frac{\partial A_z}{\partial x}, \frac{\partial A_y}{\partial x} - \frac{\partial A_x}{\partial y} \right)$$

$rot$  stands for “rotation”

In fact, the curl is a measure of how much the direction of a vector field changes in space, i.e. how much the field “rotates”.

In every point of the space,  $\overline{rot A}$  is a vector whose length and direction characterize the rotation of the field  $A$ .

The direction is the axis of rotation of  $\overline{A}$

The magnitude is the magnitude of rotation of  $\overline{A}$

# THE CURL $\text{rot} \vec{A}$

## EXAMPLE

$$\vec{A}(x, y, z) = (y, -x, 0)$$

Exercise: calculate the curl of  $\vec{A}$

**Direction:** the direction is the **axis of rotation**, i.e. perpendicular to the plane of the figure

The sign (negative, in this case) is determined by the right-hand rule

**Magnitude:** the **amount of rotation**

In this example, it is constant and independent of the position, i.e. the amount of rotation is the same at any point.

# THE CURL $\overline{rot A}$

## PHYSICAL INTERPRETATION

Consider the rotation of a rigid body around the  $z$ -axis

The coordinates of a point **P** on the body located at the distance  $a$  from the  $z$ -axis and at  $z=z_0$  changes in time:

$$x(t) = a \cos \omega t$$

$$y(t) = a \sin \omega t$$

$$z = z_0$$

The velocity of the point **P** is:

$$\left. \begin{aligned} v_x(t) &= -a\omega \sin \omega t = -\omega y(t) \\ v_y(t) &= a\omega \cos \omega t = \omega x(t) \\ v_z &= 0 \end{aligned} \right\} \Rightarrow \vec{v} = (-\omega y, \omega x, 0)$$

Therefore  $\overline{rot \vec{v}} = (0, 0, 2\omega)$

$$\overline{\omega} = \frac{1}{2} \overline{rot \vec{v}}$$

# THE STOKES' THEOREM

$$\oint_L \vec{A} \cdot d\vec{r} = \iint_S \text{rot} \vec{A} \cdot d\vec{S}$$

where  $\vec{A}$  is a vector field,  **$L$  is a closed curve** and  $S$  is a surface whose boundary is defined by  $L$ .  
 $\vec{A}$  must be continuously differentiable on  $S$

# THE STOKES' THEOREM

## PROOF

Five steps:

1. We divide  $S$  in “many” “smaller”

(infinitesimal) surfaces:

$$S = \sum_i S^i$$

2. We project  $S^i$  on:

the xy-plane  $S_z^i$

the yz-plane  $S_x^i$

the xz-plane  $S_y^i$

3. We prove the Stokes' theorem on  $S_z^i$ ,

(the only difficult part)

4. We add the results for the projections together and we obtain the Stokes' theorem on  $S^i$

5. We add the results for  $S^i$  together

and we obtain the Stokes' theorem on  $S$

# THE STOKES' THEOREM

## PROOF

Let's consider the plane surface  $S_z^i$  located in the xy-plane (i.e.  $z=\text{constant}=z_0$ ) with boundary defined by the curve  $L_z^i$

Let's calculate  $\oint_{L_z^i} \vec{A} \cdot d\vec{r}$

$$\oint_{L_z^i} \vec{A} \cdot d\vec{r} = \underbrace{\oint_{L_z^i} A_x(x, y, z_0) dx}_{\text{Term 1}} + \underbrace{\oint_{L_z^i} A_y(x, y, z_0) dy}_{\text{Term 2}} + \underbrace{\oint_{L_z^i} A_z(x, y, z_0) dz}_{\text{Term 3}}$$

**Term 3** = 0 ( $z=\text{constant}! \Rightarrow dz=0$ )

**Term 1**

$$\oint_{L_z^i} A_x(x, y, z_0) dx = \oint_{L_1 + L_2} A_x(x, y, z_0) dx =$$

$$\int_{L_1} A_x(x, y, z_0) dx + \int_{L_2} A_x(x, y, z_0) dx =$$

$$\int_a^b A_x(x, f(x), z_0) dx + \int_b^a A_x(x, g(x), z_0) dx =$$

# THE STOKES' THEOREM

PROOF

$$\begin{aligned}
 &= \int_a^b A_x(x, f(x), z_0) dx - \int_a^b A_x(x, g(x), z_0) dx = \int_a^b [A_x(x, f(x), z_0) - A_x(x, g(x), z_0)] dx = \\
 &\int_a^b \int_{g(x)}^{f(x)} \frac{\partial A_x(x, y, z_0)}{\partial y} dx dy = - \int_a^b \int_{f(x)}^{g(x)} \frac{\partial A_x}{\partial y} dx dy = - \iint_{S_z^i} \frac{\partial A_x}{\partial y} dx dy
 \end{aligned}$$

Therefore we get:

**Term 1**  $\oint_{L_z^i} A_x(x, y, z_0) dx = - \iint_{S_z^i} \frac{\partial A_x}{\partial y} dx dy$

In a similar way:

**Term 2**  $\oint_{L_z^i} A_y(x, y, z_0) dx = \iint_{S_z^i} \frac{\partial A_y}{\partial x} dx dy$

It is the z-component of  $rot \vec{A}$  !!

Adding **Term 1**, **Term 2** and **Term 3**:

$$\oint_{L_z^i} \vec{A} \cdot d\vec{r} = \iint_{S_z^i} \left( \frac{\partial A_y}{\partial x} - \frac{\partial A_x}{\partial y} \right) dx dy$$

# THE STOKES' THEOREM

So can rewrite it as:

$$\oint_{L_z^i} \bar{A} \cdot d\bar{r} = \iint_{S_z^i} (rot \bar{A})_z dx dy = \iint_{S_z^i} (rot \bar{A})_z \hat{e}_z \cdot d\bar{S}$$

$$\underbrace{dx dy = \hat{e}_z \cdot \hat{n} dS = \hat{e}_z \cdot d\bar{S}}_{}$$

In a similar way we have:

$$\oint_{L_y^i} \bar{A} \cdot d\bar{r} = \iint_{S_y^i} (rot \bar{A})_y \hat{e}_y \cdot d\bar{S}$$

$$\oint_{L_x^i} \bar{A} \cdot d\bar{r} = \iint_{S_x^i} (rot \bar{A})_x \hat{e}_x \cdot d\bar{S}$$

Now let's add everything together:

$$\underbrace{\oint_{L_x^i} \bar{A} \cdot d\bar{r} + \oint_{L_y^i} \bar{A} \cdot d\bar{r} + \oint_{L_z^i} \bar{A} \cdot d\bar{r}}_{= \oint_{L^i} \bar{A} \cdot d\bar{r}} = \underbrace{\iint_{S_x^i} (rot \bar{A})_x \hat{e}_x \cdot d\bar{S} + \iint_{S_y^i} (rot \bar{A})_y \hat{e}_y \cdot d\bar{S} + \iint_{S_z^i} (rot \bar{A})_z \hat{e}_z \cdot d\bar{S}}_{= \iint_{S^i} rot \bar{A} \cdot d\bar{S}}$$

## STOKES' THEOREM.

### Steps for the proof

- 1- Consider a closed path and a surface whose boundary is defined by the closed path.
- 2- Divide the surface in small areas  $S^i$  and consider the projection of  $S^i$  on the xy, yz, xz planes
- 3- Prove the Stokes' theorem on  $S^i$ :
  - 3.1 Write the line integral of the vector field along the boundary of  $S^i_z$  and split the integral into three terms.
  - 3.2 Consider only the integral in dx and prove that 
$$\int_{L^i_z} A_x(x, y, z_0) dx = - \iint_{S^i_z} \frac{\partial A_x}{\partial y} dx dy$$
  - 3.3 Repeat the same for the integral in dy and dz
  - 3.4 Add the three integrals in dx, dy and dz to obtain 
$$\int_{L^i_z} \vec{A} \cdot d\vec{r} = \iint_{S^i_z} (\text{rot} \vec{A})_z dx dy$$
  - 3.5 Rewrite  $dx dy$  to obtain 
$$\int_{L^i_z} \vec{A} \cdot d\vec{r} = \iint_{S^i} (\text{rot} \vec{A})_z \hat{e}_z \cdot d\vec{S}$$
- 4- Prove the Stokes' theorem on  $S^i$ :
  - 4.1 Repeat the same procedure for  $S^i_x$  and  $S^i_y$
  - 4.1 add together the expressions for the integrals in  $S^i_x$  to  $S^i_y$  and  $S^i_z$  obtaining: 
$$\int_{L^i} \vec{A} \cdot d\vec{r} = \iint_{S^i} \text{rot} \vec{A} \cdot d\vec{S}$$
- 5- Prove the Stokes' theorem on  $S$ : add together all the expressions obtained for  $S^i$

# THE STOKES' THEOREM

PROOF

$$\oint_{\vec{L}^i} \vec{A} \cdot d\vec{r} = \iint_{\vec{S}^i} \text{rot} \vec{A} \cdot d\vec{S}$$

But we are interested in the whole  $S$ .  
So we add these small contributions  
altogether:

$$\underbrace{\sum_i \iint_{\vec{S}^i} \text{rot} \vec{A} \cdot d\vec{S}}_{=} = \underbrace{\sum_i \int_{\vec{L}^i} \vec{A} \cdot d\vec{r}}_{=} = \int_L \vec{A} \cdot d\vec{r}$$

$$\oint_L \vec{A} \cdot d\vec{r} = \iint_S \text{rot} \vec{A} \cdot d\vec{S}$$

# TARGET PROBLEM

Now we can calculate the magnetic field  $\vec{B}$  at a distance  $a$  from the conductor.

Ampere's law  $\text{rot} \vec{B} = \mu_0 \vec{j}$

Where  $\vec{j}$  is the current density:

$$\oint_L \vec{B} \cdot d\vec{r} = \iint_S \text{rot} \vec{B} \cdot d\vec{S} = \iint_S \mu_0 \vec{j} \cdot d\vec{S} = \mu_0 \iint_S \vec{j} \cdot d\vec{S} = \mu_0 I$$

Stokes

Ampere

$$I = \iint_S \vec{j} \cdot d\vec{S}$$

# THE GREEN FORMULA IN THE PLANE

## THEOREM

(7.1 in the textbook)

$$\iint_D \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy = \oint_L (P dx + Q dy)$$

## PROOF

We can start from Stokes' theorem  $\oint_L \vec{A} \cdot d\vec{r} = \iint_S \text{rot } \vec{A} \cdot d\vec{S}$

$$\oint_L \vec{A} \cdot d\vec{r} = \oint_L (A_x dx + A_y dy + A_z dz) = \oint_L (A_x dx + A_y dy) \left\{ \iint_D \left( \frac{\partial A_y}{\partial x} - \frac{\partial A_x}{\partial y} \right) dx dy = \oint_L (A_x dx + A_y dy) \right.$$

But we are in a plane,  
so we can assume  $A = (A_x, A_y, 0)$

$$\iint_S \text{rot } \vec{A} \cdot d\vec{S} = \iint_S \left( \frac{\partial A_y}{\partial x} - \frac{\partial A_x}{\partial y} \right) \underbrace{\hat{e}_z \cdot \hat{e}_z}_{=1} dx dy$$

$$\begin{vmatrix} \hat{e}_x & \hat{e}_y & \hat{e}_z \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ A_x & A_y & 0 \end{vmatrix}$$

which is the Green formula  
for  $P=A_x$  and  $Q=A_y$

# CURL FREE FIELD AND SCALAR POTENTIAL

**DEFINITION:** A vector field  $\vec{A}$  is “curl free” if  $\text{rot } \vec{A} = 0$  Sometimes called “irrotational”

**THEOREM** (7.5 in the textbook)

$\text{rot } \vec{A} = 0 \Leftrightarrow$  has a scalar potential  $\phi$ ,  $\vec{A} = \text{grad } \phi$

PROOF

$$(1) \quad \text{rot } \vec{A} = 0$$

$$\oint_L \vec{A} \cdot d\vec{r} = \iint_S \text{rot } \vec{A} \cdot d\vec{S} = 0$$

If the circulation is zero, then the field is conservative and has a scalar potential. See theorem 4.5 in the textbook.

$$(2) \quad \vec{A} = \text{grad } \phi$$

$$\text{rot } \vec{A} = \text{rot grad } \phi = \text{rot} \left( \frac{\partial \phi}{\partial x}, \frac{\partial \phi}{\partial y}, \frac{\partial \phi}{\partial z} \right) = \begin{vmatrix} \hat{e}_x & \hat{e}_y & \hat{e}_z \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{\partial \phi}{\partial x} & \frac{\partial \phi}{\partial y} & \frac{\partial \phi}{\partial z} \end{vmatrix} = \left( \frac{\partial}{\partial y} \frac{\partial \phi}{\partial z} - \frac{\partial}{\partial z} \frac{\partial \phi}{\partial y}, \dots, \dots \right) = (0, 0, 0)$$

# SOLENOIDAL FIELD AND VECTOR POTENTIAL

**DEFINITION:** A vector field  $\vec{B}$  is called **solenoidal** if  $\text{div} \vec{B} = 0$

**DEFINITION:** The vector field  $\vec{B}$  has a vector potential  $\vec{A}$  if,  $\vec{B} = \text{rot} \vec{A}$

**THEOREM** (7.7 in the textbook)

$\vec{B}$  has a vector potential  $\vec{A}$ ,  $\vec{B} = \text{rot} \vec{A} \Leftrightarrow \text{div} \vec{B} = 0$

PROOF

$$(1) \vec{B} \text{ has a vector potential} \Rightarrow \vec{B} = \text{rot} \vec{A} \Rightarrow \text{div} \vec{B} = \text{div}(\text{rot} \vec{A}) = 0$$

$$(2) \text{div} \vec{B} = 0$$

Let's try to find a solution  $\vec{A}$  to the equation  $\vec{B} = \text{rot} \vec{A}$

We start looking for a particular solution  $A^*$  of this kind:

$$\vec{A}^* = (A_x^*(x, y, z), A_y^*(x, y, z), 0)$$

# CURL FREE FIELD AND SCALAR POTENTIAL

## PROOF

Assuming  $\vec{B} = \text{rot} \vec{A}$  we obtain:

$$-\frac{\partial A_y^*}{\partial z} = B_x \quad \Rightarrow \quad A_y^*(x, y, z) = -\int_{z_0}^z B_x(x, y, z) dz + F(x, y)$$

$$\frac{\partial A_x^*}{\partial z} = B_y \quad \Rightarrow \quad A_x^*(x, y, z) = \int_{z_0}^z B_y(x, y, z) dz + G(x, y)$$

$$\frac{\partial A_y^*}{\partial x} - \frac{\partial A_x^*}{\partial y} = B_z \quad \Rightarrow \quad -\int_{z_0}^z \frac{\partial B_x}{\partial x} dz + \frac{\partial F}{\partial x} - \int_{z_0}^z \frac{\partial B_y}{\partial y} dz - \frac{\partial G}{\partial y} = B_z$$

↓

$$\begin{aligned} \text{But } \text{div} \vec{B} = 0 \Rightarrow \frac{\partial B_x}{\partial x} + \frac{\partial B_y}{\partial y} = -\frac{\partial B_z}{\partial z} & \xrightarrow{\quad \underbrace{\int_{z_0}^z \frac{\partial B_z}{\partial z} dz + \frac{\partial F}{\partial x} - \frac{\partial G}{\partial y}}_{= B_z(x, y, z) - B_z(x, y, z_0)} \quad} \frac{\partial F}{\partial x} - \frac{\partial G}{\partial y} = B_z = B_z(x, y, z_0) \end{aligned}$$

A solution to this equation is: 
$$\begin{cases} F(x, y) = 0 \\ G(x, y) = -\int_{y_0}^y B_z(x, y, z_0) dy \end{cases}$$

$$\vec{A}^* = \left( \int_{z_0}^z B_y(x, y, z) dz - \int_{y_0}^y B_z(x, y, z_0) dy, \quad -\int_{z_0}^z B_x(x, y, z) dz, \quad 0 \right)$$

The general solution can be found using  $\vec{B} = \text{rot} \vec{A} \quad :$

$$\text{rot}(\vec{A} - \vec{A}^*) = \vec{B} - \vec{B} = 0 \quad \Rightarrow \quad \vec{A} - \vec{A}^* = \text{grad} \psi \quad \Rightarrow \quad \vec{A} = \vec{A}^* + \text{grad} \psi$$

# WHICH STATEMENT IS WRONG?

- 1- The curl of a vector field is a scalar (yellow)
- 2- The curl is related to the line integral of a field along a closed surface (red)
- 3- Stokes' theorem translates a line integral into a surface integral (green)
- 4- The Stokes' theorem can be applied only to a closed curve (blue)
