Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Local Application

- ▶ We are familiar with an architecture where the entire application resides **on the same computer**.

Introducing a Server

- Now, the application will be **split on two tiers** (computers).

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Introducing a Server

- ▶ Now, the application will be **split on two tiers** (computers).
- ▶ A **client** that has the view and a **server** that has controller and model.

Introducing a Server

- ▶ Now, the application will be **split on two tiers** (computers).
- ▶ A **client** that has the view and a **server** that has controller and model.
- ▶ The view is displayed in a **web browser**.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Introducing a Server

- ▶ Now, the application will be **split on two tiers** (computers).
- ▶ A **client** that has the view and a **server** that has controller and model.
- ▶ The view is displayed in a **web browser**.

This architecture is not good, we also need layers for communication.

Server-Side Communication

- First, we add a server layer, normally called **view** (a bit confusing).

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Server-Side Communication

- ▶ First, we add a server layer, normally called **view** (a bit confusing).
- ▶ However, the server side view layer performs tasks typical of a view:

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Server-Side Communication

- ▶ First, we add a server layer, normally called **view** (a bit confusing).
- ▶ However, the server side view layer performs tasks typical of a view:
 - ▶ **Creates views** (HTML), which are sent to the client.

Server-Side Communication

- ▶ First, we add a server layer, normally called **view** (a bit confusing).
- ▶ However, the server side view layer performs tasks typical of a view:
 - ▶ **Creates views** (HTML), which are sent to the client.
 - ▶ **Interprets user gestures**, a click in a web page creates a request to the server.

Server-Side Communication

- ▶ First, we add a server layer, normally called **view** (a bit confusing).
- ▶ However, the server side view layer performs tasks typical of a view:
 - ▶ **Creates views** (HTML), which are sent to the client.
 - ▶ **Interprets user gestures**, a click in a web page creates a request to the server.

It might seem that we need yet a layer, for network handling. There is such a layer, but it is in the web server. We don't write it ourselves.

Client-Side Communication

- Next, we add a client layer for communication, the **net** layer.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Client-Side Communication

- ▶ Next, we add a client layer for communication, the **net** layer.
- ▶ Actually, the browser handles most of the communication.
 - ▶ The small network code written by us is normally considered part of the client-side view, the **net layer is omitted**.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Client-Side Communication

- ▶ Next, we add a client layer for communication, the **net** layer.
- ▶ Actually, the browser handles most of the communication.
 - ▶ The small network code written by us is normally considered part of the client-side view, the **net layer is omitted**.
- ▶ This is a traditional web application.

The MVVM Pattern

- The trend is that data is stored also on the client, therefore we get a **client-side model**.

The MVVM Pattern

- ▶ The trend is that data is stored also on the client, therefore we get a **client-side model**.
- ▶ This reduces the network communication, since we do **not need to resend the entire view** each time the user does something.

Distributed Architectures

HTTP and Other Protocols

Tools

User Interface Design

The MVVM Pattern

- ▶ The trend is that data is stored also on the client, therefore we get a **client-side model**.
- ▶ This reduces the network communication, since we do **not need to resend the entire view** each time the user does something.
- ▶ Thereby, the application becomes faster.

The MVVM Pattern

- ▶ The trend is that data is stored also on the client, therefore we get a **client-side model**.
- ▶ This reduces the network communication, since we do **not need to resend the entire view** each time the user does something.
- ▶ Thereby, the application becomes faster.
- ▶ This is referred to as the **MVVM**, model-view-viewmodel pattern.

Programming Languages

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- This is the architecture we will normally use during the course.

Programming Languages

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

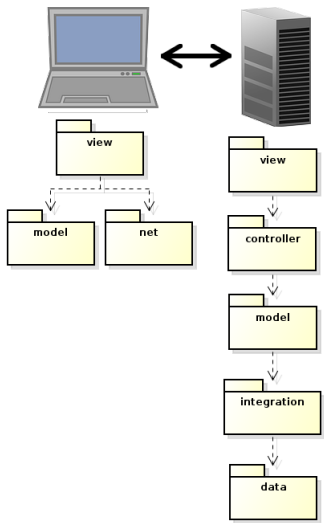

- ▶ This is the architecture we will normally use during the course.
- ▶ The view is programmed in **HTML** and **CSS**, client side behavior is programmed in **JavaScript** and the entire server side code is written in **PHP**.

Three-Tier Architecture

- Of course, we also need to store data. That is done in the **data** layer, which is often a database.

Three-Tier Architecture

- ▶ Of course, we also need to store data. That is done in the **data** layer, which is often a database.
- ▶ We also introduce the **integration** layer, to handle the database calls.

Three-Tier Architecture (Cont'd)

- ▶ In a bigger application, we would most likely place the database in a separate node.

Three-Tier Architecture (Cont'd)

- ▶ In a bigger application, we would most likely place the database in a separate node.
- ▶ This is called **three-tier architecture** and is, since long time, the **dominating architecture** for web applications.

Event-Driven Architecture

- In the latest year, there is a growing tendency to move business logic to the client, perhaps completely remove the server-side model.

Event-Driven Architecture

- ▶ In the latest year, there is a growing tendency to move business logic to the client, perhaps completely remove the server-side model.
- ▶ This is made possible with **web sockets**, which enable **full duplex** browser-server communication.

Event-Driven Architecture

- ▶ In the latest year, there is a growing tendency to move business logic to the client, perhaps completely remove the server-side model.
- ▶ This is made possible with **web sockets**, which enable **full duplex** browser-server communication.
- ▶ The motive is to reduce communication latency. The browser informs the server about user actions, but does **not wait for response** before updating the view.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

The IP Protocol

- ▶ All Internet communication is based on the Internet Protocol (IP).

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

The IP Protocol

- ▶ All Internet communication is based on the Internet Protocol (IP).
- ▶ IP provides basic functionality for sending and receiving data.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

The IP Protocol

- ▶ All Internet communication is based on the **Internet Protocol (IP)**.
- ▶ IP provides basic functionality for sending and receiving data.
- ▶ Data is sent in chunks, called **packages**. A package is like an envelope for a letter. It has sender and a receiver addresses and a content, which is the data being transmitted.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

The IP Protocol

- ▶ All Internet communication is based on the **Internet Protocol (IP)**.
- ▶ IP provides basic functionality for sending and receiving data.
- ▶ Data is sent in chunks, called **packages**. A package is like an envelope for a letter. It has sender and a receiver addresses and a content, which is the data being transmitted.
- ▶ A node (computer) receiving a packet can **accept** it, **ignore** it or **retransmit** it.

User Interface
Design

IP Address

- ▶ An internet (version 4) address has 32 bits divided into **four bytes**, [0-255].[0-255].[0-255].[0-255]. Each node connected to the internet has one or more addresses.
- ▶ Normally, an IP address must be **unique**, assigned only to one node.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

IP Address

- ▶ An internet (version 4) address has 32 bits divided into **four bytes**, [0-255].[0-255].[0-255].[0-255]. Each node connected to the internet has one or more addresses.
- ▶ Normally, an IP address must be **unique**, assigned only to one node.
- ▶ Some addresses, like 192.168.X.X are dedicated to **private networks** and can be used freely. Such an address is not transmitted on the public internet. Instead, it is **translated** to a public address by a router.

The TCP Protocol

- ▶ TCP, Transmission Control Protocol, is used on top of the IP protocol.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

The TCP Protocol

- ▶ TCP, Transmission Control Protocol, is used on top of the IP protocol.
- ▶ TCP adds transport guarantees, for example the following.

The TCP Protocol

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ TCP, Transmission Control Protocol, is used on top of the IP protocol.
- ▶ TCP adds transport guarantees, for example the following.
 - ▶ Packets are delivered to the receiver in the **same order** they are sent by the sender.

The TCP Protocol

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ TCP, Transmission Control Protocol, is used on top of the IP protocol.
- ▶ TCP adds transport guarantees, for example the following.
 - ▶ Packets are delivered to the receiver in the **same order** they are sent by the sender.
 - ▶ Delivered packets have the **same content** as sent packets.

The TCP Protocol

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ TCP, Transmission Control Protocol, is used on top of the IP protocol.
- ▶ TCP adds transport guarantees, for example the following.
 - ▶ Packets are delivered to the receiver in the **same order** they are sent by the sender.
 - ▶ Delivered packets have the **same content** as sent packets.
 - ▶ There are **no lost packets**.

The TCP Protocol (Cont'd)

- ▶ TCP is **connection-oriented**, think of a telephone line as opposed to sending a letter. To establish a TCP connection is a slow operation.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

The TCP Protocol (Cont'd)

- ▶ TCP is **connection-oriented**, think of a telephone line as opposed to sending a letter. To establish a TCP connection is a slow operation.
- ▶ TCP handles **ports**, which makes it possible to have multiple connections with the same IP address open simultaneously. A port is identified by a number. An endpoint of a TCP connection has an IP address and a port number.

DNS

- ▶ IP addresses are normally translated to **names** (instead of numbers). Such a name is called **domain name**.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

DNS

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ IP addresses are normally translated to **names** (instead of numbers). Such a name is called **domain name**.
- ▶ Domain names are divided into **subdomains**, divided by dots (.)
 - ▶ The address **www.ict.kth.se** consists of the subdomain **www**, which is part of the subdomain **ict**, which is part of **kth**, which is part of **se**, which is part of the root, **.**

DNS

- ▶ A Uniform Resource Locator, URL defines a resource's location on the internet.
- ▶ A URL consists of four parts.
 1. A protocol, e.g., **http**
 2. A host (IP address or name),
http://www.kth.se
 3. A port number (optional). The default HTTP port number is 80.
http://www.kth.se:8080
 4. A path, which identifies the resource's location on the server.
http://www.kth.se:8080/abc/index.html

URN and URI

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ A **Uniform Resource Name, URN** is a resource identifier without host name and port number. A typical example is a isbn identifying a book.

URN and URI

- ▶ A **Uniform Resource Name, URN** is a resource identifier without host name and port number. A typical example is a isbn identifying a book.
- ▶ A **Uniform Resource Identifier, URI** is either a URL or URN.

HTTP

- ▶ **HyperText Transfer Protocol, HTTP** is used for communication between web browsers and web servers.

HTTP

- ▶ HyperText Transfer Protocol, HTTP is used for communication between web browsers and web servers.
- ▶ HTTP is based on TCP, which means a TCP connection is established for each browser-server communication.

The Request-Response Cycle

A HTTP communication typically proceeds as follows.

1. The client **opens** a TCP connection to the server.

The Request-Response Cycle

A HTTP communication typically proceeds as follows.

1. The client **opens** a TCP connection to the server.
2. The client sends a **request** for a resource on the server. The request consists of a HTTP header, and data if the user submitted data to the server.

The Request-Response Cycle

A HTTP communication typically proceeds as follows.

1. The client **opens** a TCP connection to the server.
2. The client sends a **request** for a resource on the server. The request consists of a HTTP header, and data if the user submitted data to the server.
3. The server sends a **response** to the client. Also the response consists of HTTP headers, and data if the response required data.

The Request-Response Cycle

A HTTP communication typically proceeds as follows.

1. The client **opens** a TCP connection to the server.
2. The client sends a **request** for a resource on the server. The request consists of a HTTP header, and data if the user submitted data to the server.
3. The server sends a **response** to the client. Also the response consists of HTTP headers, and data if the response required data.
4. The server **closes** the TCP connection.

The Request-Response Cycle (Cont'd)

- ▶ HTTP is **stateless**. Neither server nor browser remembers anything about previous request-response cycles. Session handling must be added in server-side code.

The Request-Response Cycle (Cont'd)

- ▶ HTTP is **stateless**. Neither server nor browser remembers anything about previous request-response cycles. Session handling must be added in server-side code.
- ▶ To establish a TCP connection is expensive. Therefore, TCP connections might be **kept alive** and reused for multiple request-response cycles. This is specified with the **keep-alive** HTTP header, see below.

Cookies

- ▶ A cookie is a **piece of data** that is stored on the client.

Cookies

- ▶ A cookie is a **piece of data** that is stored on the client.
- ▶ The cookie is **tagged** with the server's domain name and **included** in every request to that server.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

Cookies

- ▶ A cookie is a **piece of data** that is stored on the client.
- ▶ The cookie is **tagged** with the server's domain name and **included** in every request to that server.
- ▶ This enables the server to **associate** data with a specific client.

Distributed
Architectures

HTTP and Other
Protocols

User Interface
Design

Cookies

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ A cookie is a **piece of data** that is stored on the client.
- ▶ The cookie is **tagged** with the server's domain name and **included** in every request to that server.
- ▶ This enables the server to **associate** data with a specific client.
- ▶ Cookies can be used to **store the user's settings**, for example display language.

HTTP Sessions

- ▶ As mentioned above, HTTP is stateless.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

HTTP Sessions

- ▶ As mentioned above, HTTP is stateless.
- ▶ Still, the server must be able to recognize which calls **originate from the same** client. Otherwise for example log in is impossible.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

HTTP Sessions

- ▶ As mentioned above, HTTP is stateless.
- ▶ Still, the server must be able to recognize which calls **originate from the same** client. Otherwise for example log in is impossible.
- ▶ One commonly used method to solve this problem is to **use cookies**.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

HTTP Sessions

- ▶ As mentioned above, HTTP is stateless.
- ▶ Still, the server must be able to recognize which calls **originate from the same** client. Otherwise for example log in is impossible.
- ▶ One commonly used method to solve this problem is to **use cookies**.
- ▶ If a request has a cookie with a session identifier, it **identifies** the user. If there is no such cookie, the user does not have a running session.

HTTP Methods

- ▶ HTTP 1.1 has eight different methods that requires the following server actions.
 - GET** Deliver resource identified by the specified URL.
 - POST** Accept message body and deliver it to the resource at the specified URL.
 - PUT** Accept message body and store it as a resource with the specified URL.
 - DELETE** Delete the resource at the given URL.

HTTP Methods

- ▶ HTTP 1.1 has eight different methods that requires the following server actions.

GET Deliver resource identified by the specified URL.

POST Accept message body and deliver it to the resource at the specified URL.

PUT Accept message body and store it as a resource with the specified URL.

DELETE Delete the resource at the given URL.

HEAD Like GET, but only deliver headers.

HTTP Methods

- ▶ HTTP 1.1 has eight different methods that requires the following server actions.
 - GET** Deliver resource identified by the specified URL.
 - POST** Accept message body and deliver it to the resource at the specified URL.
 - PUT** Accept message body and store it as a resource with the specified URL.
 - DELETE** Delete the resource at the given URL.
 - HEAD** Like GET, but only deliver headers.
 - TRACE** Return the request message.

HTTP Methods

- ▶ HTTP 1.1 has eight different methods that requires the following server actions.
 - GET** Deliver resource identified by the specified URL.
 - POST** Accept message body and deliver it to the resource at the specified URL.
 - PUT** Accept message body and store it as a resource with the specified URL.
 - DELETE** Delete the resource at the given URL.
 - HEAD** Like GET, but only deliver headers.
 - TRACE** Return the request message.
 - OPTIONS** Tell which HTTP methods can be used with the specified URL.

HTTP Methods

- ▶ HTTP 1.1 has eight different methods that requires the following server actions.
 - GET** Deliver resource identified by the specified URL.
 - POST** Accept message body and deliver it to the resource at the specified URL.
 - PUT** Accept message body and store it as a resource with the specified URL.
 - DELETE** Delete the resource at the given URL.
 - HEAD** Like GET, but only deliver headers.
 - TRACE** Return the request message.
 - OPTIONS** Tell which HTTP methods can be used with the specified URL.
 - CONNECT** Connect to another host.

HTTP Methods

- ▶ HTTP 1.1 has eight different methods that requires the following server actions.
 - GET** Deliver resource identified by the specified URL.
 - POST** Accept message body and deliver it to the resource at the specified URL.
 - PUT** Accept message body and store it as a resource with the specified URL.
 - DELETE** Delete the resource at the given URL.
 - HEAD** Like GET, but only deliver headers.
 - TRACE** Return the request message.
 - OPTIONS** Tell which HTTP methods can be used with the specified URL.
 - CONNECT** Connect to another host.
- ▶ **GET** and **POST** are the most common methods and the only ones we will use in this course.

Safe and Idempotent Methods

- ▶ **GET** and **HEAD** are **safe** methods, which means they should not take any action other than to retrieve the specified resource.

User Interface
Design

Safe and Idempotent Methods

- ▶ **GET** and **HEAD** are **safe** methods, which means they should not take any action other than to retrieve the specified resource.
- ▶ **GET, HEAD, PUT, DELETE, OPTIONS** and **TRACE** are **idempotent** methods, which means the same request can be sent multiple times without any side-effects on the server.

Safe and Idempotent Methods

- ▶ **GET** and **HEAD** are **safe** methods, which means they should not take any action other than to retrieve the specified resource.
- ▶ **GET**, **HEAD**, **PUT**, **DELETE**, **OPTIONS** and **TRACE** are **idempotent** methods, which means the same request can be sent multiple times without any side-effects on the server.
- ▶ **POST** is not idempotent. If you submit the same purchase order multiple times in a web shop you will probably buy multiple items. The purchase is typically a **POST** request.

When to Use GET

- ▶ Use **GET** when
 - ▶ The only desired action is to **retrieve** the specified resource.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

When to Use GET

- ▶ Use **GET** when
 - ▶ The only desired action is to **retrieve** the specified resource.
 - ▶ If it shall be possible to **bookmark** the link.

When to Use GET

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ Use **GET** when
 - ▶ The only desired action is to **retrieve** the specified resource.
 - ▶ If it shall be possible to **bookmark** the link.
 - ▶ The URL is **shorter than 255 bytes**. Note that a **GET** URL is longer than a **POST** URL since data is included in the URL which **GET**, but is in the message body with **POST** (see below).

When to Use GET

- ▶ Use **GET** when
 - ▶ The only desired action is to **retrieve** the specified resource.
 - ▶ If it shall be possible to **bookmark** the link.
 - ▶ The URL is **shorter than 255 bytes**. Note that a **GET** URL is longer than a **POST** URL since data is included in the URL which **GET**, but is in the message body with **POST** (see below).
 - ▶ You want to be able to **write** the entire request, including data, in the **browser**. This is useful when debugging.

When to Use POST

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

- ▶ Use **POST** when
 - ▶ The required action **updates** server state, for example saves something in a database.

When to Use POST

- ▶ Use **POST** when
 - ▶ The required action **updates** server state, for example saves something in a database.
 - ▶ The data **does not fit** within the 255 byte limit for URLs.

When to Use POST

- ▶ Use **POST** when
 - ▶ The required action **updates** server state, for example saves something in a database.
 - ▶ The data **does not fit** within the 255 byte limit for URLs.
 - ▶ The data shall **not appear** in the URL. Note that this is not a matter of security, data is sent in clear text also when using **POST**.

HTTP Parameters

- ▶ HTTP parameters are **data** included in a request to a web server.

Distributed
Architectures

HTTP and Other
Protocols

Tools

User Interface
Design

HTTP Parameters

- ▶ HTTP parameters are **data** included in a request to a web server.
- ▶ A typical example is when the user has entered data in a HTML form.

HTTP Parameters

- ▶ HTTP parameters are **data** included in a request to a web server.
- ▶ A typical example is when the user has entered data in a HTML form.

- ▶ When using the **GET** method, parameters are appended to the URL as a **query string**,
`http://some.domain/
some/path?city=stockholm&country=sweden`

HTTP Parameters

- ▶ HTTP parameters are **data** included in a request to a web server.
