

AF2003 Structural Engineering, Advanced Course 7.5 credits

Bärverksanalys, avancerad kurs

This is a translation of the Swedish, legally binding, course syllabus.

If the course is discontinued, students may request to be examined during the following two academic years

Establishment

Course syllabus for AF2003 valid from Autumn 2007

Grading scale

A, B, C, D, E, FX, F

Education cycle

Second cycle

Main field of study

Built Environment

Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

Intended learning outcomes

The main goal of the course is to give deepened knowledge for the analysis and design of building structures with special reference to load bearing resistance. After having passed the course the student should be able to:

- Calculate the distribution of bending moments, shear and normal forces for statically indeterminate beams and frames within the elastic range.
- Explain the static action of different types of bolted joints in steel structures.
- Calculate the load bearing resistance of these types of joints.
- Explain local buckling, buckling and flexural buckling.
- Calculate the load bearing resistance of beams and columns of steel regarding local buckling, buckling and flexural buckling.
- Explain the ultimate limit state for a normal and an over reinforced, reinforced concrete section in bending.
- Explain the principle of addition and the truss analogy for reinforced concrete beams in shear.
- Explain the principles for the reinforcement of frame corners.
- Explain the mode of action of deep beams, walls and corbels.
- Calculate the load bearing resistance in the ultimate state of long reinforced concrete beams, deep concrete beams, concrete walls and reinforced concrete corbels.

Course contents

- Statically indeterminate beams and frames
- Joints in steel structures, analysis and design
- Local buckling of steel sections
- Buckling of columns and systems of columns
- Flexural buckling of beams in compression and bending
- Design of steel structures with special reference to instability
- Design of beams, columns and frames of reinforced concrete with special reference to bending, shear and instability.
- Mode of action and design of deep concrete beams, concrete walls and concrete corbels

Specific prerequisites

AF1005 Structural Engineering, basic course or similar course
Fundamental courses in Structural mechanics and design

Course literature

Will be announced at the beginning of the course.

Examination

- TEN1 - Examination, 4.5 credits, grading scale: A, B, C, D, E, FX, F
- ÖVN1 - Exercises, 3.0 credits, grading scale: P, F

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

Other requirements for final grade

Passed written exam (4,5 cr)

Passed exercises (3 cr)

Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
