

# DD2432 Artificial Neural Networks and Other Learning Systems 6.0 credits

Artificiella neuronnät och andra lärande system

This is a translation of the Swedish, legally binding, course syllabus.

#### **Establishment**

## **Grading scale**

A, B, C, D, E, FX, F

#### **Education cycle**

Second cycle

### Main field of study

Information Technology, Information and Communication Technology, Computer Science and Engineering

## Specific prerequisites

# Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

### Intended learning outcomes

After the course the student should be able to

- explain the function of artificial neural networks of the Back-prop, Hopfield, RBF and SOM type
- explain the difference between supervised and unsupervised learning
- describe the assumptions behind, and the derivations of the ANN algorithms dealt with in the course
- give example of design and implementation for small problems
- implement ANN algorithms to achieve signal processing, optimization, classification and process modeling

so that the student

- achieves an understanding of the technical potential and the advantages and limitations of the learning and self organizing systems of today
- can apply the methods and produce applications in their working life

#### Course contents

The course covers algorithms which gets its computational capabilities by training from examples. There is thus no need to explicitly provide rules and instead training using measured data is performed. Learning can be done either by providing the correct answer, or be totally autonomous.

The courser also covers principles of representation of data in neural networks. The course also includes principles of hardware architectures (euro chips and neuro computers) and shows how ANN can be used in robotics. We also show applications of learning systems in areas like pattern recognition, combinatorial optimization, and diagnosis.

#### Course literature

To be announced at least 2 weeks before course start at course web page. Previous year: Fausett, Fundamentals of Neural Networks, Prentice Hall.

#### **Examination**

- TEN2 Examination, 3.0 credits, grading scale: A, B, C, D, E, FX, F
- LAB2 Laboratory Assignments, 3.0 credits, grading scale: P, F

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

If the course is discontinued, students may request to be examined during the following two academic years.

# Other requirements for final grade

Examination (TEN2; 3 university credits). Laboratory assignments (LAB2; 3 university credits).

#### Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
