

# EG2121 FACTS and HVDC in Electric Power Systems 7.5 credits

FACTS och HVDC i elkraftsystem

This is a translation of the Swedish, legally binding, course syllabus.

If the course is discontinued, students may request to be examined during the following two academic years

## Establishment

The official course syllabus is valid from the autumn semester 2022 in accordance with the decision from the head of school: J-2022-0271. Decision date: 2022-03-22.

## Grading scale

P, F

#### **Education cycle**

Second cycle

## Main field of study

**Electrical Engineering** 

#### Specific prerequisites

Knowledge in stability and dynamics of electric power system, 7.5 higher education credits, equivalent to completed course EG2110.

Knowledge in power electronics, 6,0 higher education credits, equivalent to completed course EJ2301.

## Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

## Intended learning outcomes

After passing the course, the student shall be able to

1. create basic mathematical models for controllable devices (FACTS and HVDC) and apply different control strategies to these controllable devices

2. regulate voltages and power flow in electric power systems on the basis of these mathematical models and control strategies

3. both orally and in writing present and explain the results of a project in which the impact of controllable devices on power system stability and damping will be analysed.

## **Course contents**

FACTS (Flexible AC Transmission System) and HVDC (High Voltage Direct Current) transmission are power electronics-based devices whose functions are to enhance the capacity, security and flexibility of power transmission systems. Application of these devices to power systems implies an enhancement of transient and voltage stability, increase of power oscillation damping (POD) and improvement of power flow under normal operations or post-fault conditions. The course presents basic mathematical models and control strategies for being able to analyse, how these devices affect power system stability. Most part of the analysis is dedicated to POD which is the main topic of this course. A part of the course shows how one uses the most important functions in the necessary software.

## Examination

• PRO1 - Projet work, 7.5 credits, grading scale: P, F

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

# Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
