

FEL3230 Graduate Course on Hybrid Systems 7.5 credits

Doktorandkurs i hybrida system

This is a translation of the Swedish, legally binding, course syllabus.

If the course is discontinued, students may request to be examined during the following two academic years

Establishment

Course syllabus for FEL3230 valid from Spring 2015

Grading scale

Education cycle

Third cycle

Specific prerequisites

Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

Intended learning outcomes

After the course, the student should be able to:

•know the essential theoretical tools to model hybrid control systems and cope with related verification problems

- \cdot know the essential problems and results in the area
- \cdot apply the theoretical tools to problems in the area
- \cdot contribute to the research frontier in the area

Course contents

Lecture 1: Course outline. Introduction to hybrid systems. Motivating examples. Modelling and hybrid Automata. Zeno behavior.

Lecture 2: Stability of hybrid systems. Multiple Lyapunov Functions.

Lecture 3: Stabilization of hybrid systems. Quantized and event-based control.

Lecture 4: Transitions systems, simulation and bisimulation relations for transition systems, motivational examples (motion planning problem-higher level specifications). Control systems as transition systems. Examples of transition systems as abstractions for control systems.

Lecture 5: Bisimulation relations for linear control systems (generalization of state space equivalence). Approximate simulation and bisimulation relations.

Lecture 6: Approximate symbolic models for control systems. Symbolic models for certain classes of nonlinear systems.

Lecture 7: Verification of hybrid systems: motivation, problems, approaches. Verification via abstraction. Safety and reachability analysis of finite transition systems. Verification of timed automata, region graphs.

Lecture 8: Symbolic reachability analysis of hybrid systems. Reachability computation via over-approximation. Flow pipes.

Lecture 9: Advanced verification questions. Temporal logics, model checking. Automata-based approach to LTL model checking.

Lecture 10: Project presentations.

Disposition

Lectures, relevant list of papers/book chapters.

Examination

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

Other requirements for final grade

Passing Grade based on 3 homework assignments and final project presentations.

Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
