

FSG3112 Turbulence 9.0 credits

Turbulens

This is a translation of the Swedish, legally binding, course syllabus.

If the course is discontinued, students may request to be examined during the following two academic years

Establishment

Course syllabus for FSG3112 valid from Spring 2019

Grading scale

P, F

Education cycle

Third cycle

Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

Intended learning outcomes

The primary aim of the course is to give the students an overview of turbulent flow and turbulence.

After completing the course a student should be able to;

- use statistical methods to describe and analyse turbulent flow,
- describe and explain the lengthscale structure of turbulence, and
- use an understanding of turbulence to describe the strengths and weaknesses of common CFD models for turbulent flow.

- describe/give examples of how fluid dynamics research can address aspects of sustainability

Course contents

Fundamental phenomena and concepts. Statistical methods. Shear-flow turbulence and the turbulent boundary layer. CFD models for turbulent flow. The theory of isotropic and homogeneous turbulence.

Specific prerequisites

SG2214 Fluid Mechanics, or equivalent.

Course literature

Recommended course book; “Turbulent Flows” by S.B. Pope (CUP, 2000).

Alternative; Ch. 13, “Turbulence”, in “Fluid Mechanics” by Kundu & Cohen (Elsevier, 2004).

Examination

- INL1 - Assignment, 1.5 credits, grading scale: P, F
- LIT1 - Literature assignment, 1.5 credits, grading scale: P, F
- TEN1 - Oral exam, 6.0 credits, grading scale: P, F

Based on recommendation from KTH’s coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

INL1 Assignment 1,5 hp (P, F)

LIT1 Literature assignment 1,5 hp (P, F)

TEN1 Oral exam 6,0 hp (P, F)

Other requirements for final grade

Practical laboratory exercise; homework; and a written test or oral examination. Doctoral students should carry out and present a short literature project. The literature project should comprise a summary and analysis of the approaches to relevant turbulence research issues addressed in typically two selected journal papers. The literature project should also address possible sustainability aspects of the selected papers and of the specific research project of the PhD student.

Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
