

IK2215 Advanced Internetworking 7.5 credits

Avancerad internetteknik

This is a translation of the Swedish, legally binding, course syllabus.

Establishment

Course syllabus for IK2215 valid from Autumn 2008

Grading scale

A, B, C, D, E, FX, F

Education cycle

Second cycle

Main field of study

Electrical Engineering, Computer Science and Engineering

Specific prerequisites

Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

Intended learning outcomes

Students will get a deep understanding of layer 2 and layer 3 protocols and hands-on experience in setting up and operating TCP/IP networks. _This means that, after the course, students will be able to:

___* describe the functionality of devices and explain design principles of protocols at the link and network layers (such as bridges/switches, spanning tree, routers, link-state routing protocols, multicast, address structures).

___* critically evaluate existing as well as new communication protocols designs in general and link and network layer protocols in particular, using technical considerations such as scalability, robustness, and manageability as a basis of comparison.

___* based on general principles and studies of different protocol standards (such as IP, AppleTalk, IPX, CLNP, OSPF) compare and describe advantages and disadvantages of different protocol designs.

___* **design, configure, and operate a TCP/IP network, and to provide TCP/IP services to end-users, using primarily PC hardware and Unix. Students will be able to set up and describe how the following services work: - dynamic address assignment (DHCP) - interior routing protocols - domain name system (DNS) - TCP/IP application servers, such as mail and web**

Course contents

This course focuses on network and link layer communication protocols, and the emphasis is on the generic mechanisms at these two layers. To get a deeper understanding of these mechanisms we evaluate and compare the design of different protocols, i.e., not only Ethernet and TCP/IP. To further illustrate these principles and get hands-on experience the course contains a set of lab assignments and a project.

Course literature

Computer Networking, A Top-Down Approach: International Edition, Fourth Edition by James F. Kurose, Keith W. Ross

ISBN-10:0-321-51325-8

Examination

- PRO1 - Project work, 1.5 credits, grading scale: P, F
- TEN1 - Examination, 3.0 credits, grading scale: A, B, C, D, E, FX, F
- LAB1 - Laboratory Work, 3.0 credits, grading scale: P, F

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

If the course is discontinued, students may request to be examined during the following two academic years.

Other requirements for final grade

__The course is divided into three parts, and to receive a final grade "pass" all three parts must be approved:

- ___ * Written exam (A-F)
- ___ * Laborations (Pass/Fail)
- ___ * Project assignment (Pass/Fail)

__The final degree is based on the result of the written exam. To receive grade "pass", the student should be able to describe and explain design principles for communication protocols dealt with during the course, as well as be able to apply these protocols in real TCP/IP networks. To receive a higher grade, the student should also be able to critically evaluate and assess different communication protocols as well as be able to compare and explain advantages and disadvantages with various protocol designs.

Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
