

SE1020 Solid Mechanics, Basic Course 9.0 credits

Hållfasthetslära, grundkurs

This is a translation of the Swedish, legally binding, course syllabus.

If the course is discontinued, students may request to be examined during the following two academic years

Establishment

Course syllabus for SE1020 valid from Autumn 2011

Grading scale

A, B, C, D, E, FX, F

Education cycle

First cycle

Main field of study

Technology

Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

Intended learning outcomes

In design and development of advanced products and process, it is important to assure the functionality. All products and processes are required to have the correct stiffness and not to break under service. In this course, you will learn about the mechanical properties of materials and components and how this knowledge is used to design products and processes with respect to stiffness and strength. Knowledge in strength of materials and solid mechanics design will make product development much more efficient since you will be able to answer question such as "Does it break?" or "Will there be too much deformations?" even before the prototypes has been built.

After the course, the participant should be able to

- determine stresses and deformations in truss structures, frames and composites using models for rods and beams
- determine stresses and deformations in axisymmetric structures.
- determine the loading applied on a crack.
- design the structures mentioned above from knowledge of the applied loading and the mechanical behaviour of the material.
- determine the applicability of the models above and also understand the order of the approximations included in the models.

Course contents

To acquire knowledge about the basic principles and terminology of solid mechanics, mechanical behaviour of engineering materials, methods to solve important types of solid mechanics problems and ability to apply this knowledge for solution of simple problems of practical importance.

Specific prerequisites

CMATD: Calculus in One Variable, Calculus in Several Variable, Mechanics I and Perspectives on Materials Design

CDEPR: Calculus in One Variable, Calculus in Several Variable, Mechanics I and Introduction to Design and Product Realisation

Other program: the equivalent courses

Course literature

H. Lundh, Grundläggande Hållfasthetslära, KTH, Hållfasthetslära , 2013

Exempelsamling i hållfasthetslära, KTH, Hållfasthetslära, 2014

Handbok och formelsamling i hållfasthetslära, KTH, Hållfasthetslära, 2014

Examination

- KON1 - Test, 3.0 credits, grading scale: P, F
- LAB1 - Laboratory Work, - credits, grading scale: P, F

- TEN1 - Examination, 6.0 credits, grading scale: A, B, C, D, E, FX, F

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

Other requirements for final grade

Written exam (TEN1; 6 university credits),
passed tests (KON1; 3 university credits),
laboratory (LAB1; 0 university credits).

Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
