Utbildningsplan

Masterprogram, nätverkstjänster och system
Master's Programme, Network Services and Systems, 120 credits
120,0 högskolepoäng

Gäller för antagna till utbildningen fr o m HT14.

Utbildningens mål

The field of communication has radically changed our lives and societies. We now take communication services that only have become widely available during the last ten years for granted: for instance, the Web and its search engines; Internet and mobile telephony or peer-to-peer file sharing and social networks. Such services affect our daily lives, they free us in the choice of how and where we work, relax play and socialize. The design of communication networks and services is therefore central for future developments of our societies. The Network Services and Systems master program provides the competence needed to work in this dynamic, challenging and highly interesting field of engineering, addressing emerging networking paradigms for Internet of Things, cloud computing and cyberphysical systems. The programme covers the foundations of Internetworking, wireless networks, network security and management of large distributed systems. Students can then follow the Design and Technology track addressing a wide range of emerging networks, networked services and mathematical tools, or the Enterprise track, focusing on the design of industrial IT systems. The skill-set includes analytic and simulation tools for evaluating the performance of the systems, as well as a sharpened proficiency in programming.

Kunskap och förståelse

For the Master’s Degree, the student should be able to know and understand:

- The scientific fundamentals and practical applications of computer communication for both wired and wireless networks
- Protocol models and their realization, considering wireless networks and internet protocols, network security and network management
- Deep understanding in areas emerging networking technologies, network security, large distributed systems, IT system management
- Mathematical modeling, simulation methodology and systems experimentation for functional and performance evaluation
- Scientific methodology and its application on the field of the program.
Färdigheter och förmågor

For the Master’s Degree, the student should be able to:

- mathematically analyze network functions and protocols,
- specify, design and construct parts of communication systems and to implement them in software
- present technical systems and results from studies both orally and in writing, as well as to hold demonstrations of systems
- work independently and in group, to plan and lead work, critically evaluate the quality of own work and to be able to continuously improve it
- read and understand research results within the field and to apply the results.

Värderingsförmåga och förhållningssätt

For the Master’s Degree, the student should be able to:

- apply a scientific approach to his or her own technical work
- be conscious of the possibilities and limitations of technology, its role in society and how it is being used nationally and internationally
- be aware of ethical issues concerning research and development.

Utbildningens omfattning och innehåll

The program is at the second level and comprises two years of full time study, 120 higher education credits, corresponding to 120 ECTS credits. The program includes compulsory courses in the area of network systems and services, and two tracks, Design and Technology, and Enterprise, preparing for research and development or entrepreneurship in the area. The language of instruction throughout the program is English.

Behörighet och urval

Basic admission requirements Basic eligibility to be accepted to the master’s program requires a completed Bachelor’s degree, corresponding to a Swedish Bachelor’s degree (180 higher education credits), or equivalent academic qualifications from an internationally recognised university. Students should have in addition, good knowledge in English, both in oral and in written forms. Applicants must provide proof of their proficiency in English. For all program at KTH where English is the language of instruction, the specific eligibility requirement is English B or equivalent.

Specific admission requirements Specific eligibility to the programme requires:The previous Degree should include:

- at least 60 higher education credits of course work in electrical engineering, computer engineering or computer science
- basic courses in mathematics, including calculus, linear algebra and mathematical statistics
- courses passed with distinction in programming (preferably C or Java).

It is recommended that applicants have experience in solving problems using computational software, particularly MATLAB and passed courses covering operating systems and signals and systems.
The specific eligibility requirements can be assessed as not-fulfilled if:

1. the average grade is less than 75% of the highest grade
2. the degree awarding institution is not considered to meet acceptable quality standards by the authorities of the country in which the institution is located
3. the degree does not qualify for admission to equivalent Master level in the country where the degree is awarded.

The number of places within the study programme is limited. Places in the programme are filled by a selection according to the merit worth which is based on knowledge, work experience and other education-related experiences. Places in the programme are also made available to students with consideration to the bilateral exchange agreements signed by the School of Electrical Engineering for the programme. In order to assess the merit worth, an assessment of the applicant’s knowledge (the applicant’s previous education, from which university the degree was received, subjects), work experience, and other education-related experiences (motivation to study, references) is carried out. The applicant’s academic results are given higher weight than the other parameters.

Utbildningens genomförande

Utbildningens upplägg

The program extends over two academic years. Each academic year spans 40 weeks and it is divided into four seven-weeks long study periods. Each study period is concluded by an examination period of between two and five days. There are three extra examination periods for make-up exams following Christmas, following the ordinary examinations in May and immediately before the start of the study period of the academic year.

Kurser

Utbildningen sker i kursform. Kurslistor finns i bilaga 1.

The education in the program consists of a course block and a master’s thesis project for 120 ECTS. The courses are studied during the first six study periods and include 42.5 ECTS credits of obligatory courses, 22.5 ECTS credits of conditionally obligatory courses, depending on the chosen track. Finally, courses can be freely selected from all KTH courses. The program is concluded by the thesis project that comprises 30 ECTS credits, a full semester of work.

Betygssystem

För kurser på KTH används en sjugradig målrelaterad betygsskala A-F som slutbetyg för kurser på grundnivå och avancerad nivå. A-E är godkända betyg med A som högsta betyg. Betygen godkänd (P) och underkänd (F) används som slutbetyg då särskilda skäl föreligger.

Courses in the first and the second level are graded on a scale from A to F. A-E are passing grades, A is the highest grade.

Villkor för deltagande i utbildningen
Each student is responsible for registering for the term at the beginning of each term. This is done via the "personal menu" on KTH’s website. There is a limited time window for doing this. Term registration indicates that the student is active and opens the system so that results may also be reported.

Signing up for courses is done via https://www.universityadmissions.se. The system there for choosing courses is open from 1-15 November and 1-15 May, unless other information is posted.

For promotion to study year two, the student must have received at least 45 higher education credits from the first year. In order to receive the degree, the student must fulfil the criteria for at least one of the specializations.

**Tillgodoräknanden**

Under certain circumstances, and in agreement with the programme director, credits for previous studies can be received according to the local policy of KTH, see http://intra.kth.se/regelverk/utbildning-forskning/grundutbildning/prestationer/policy-for-tillgodoraknande-av-hogskoleutbildning-inklusive-bedömning-av-reell-kompetens-1.27200?l=en_UK

**Utlandsstudier**

Exchange studies for course work abroad is available according to the exchange programs implemented at KTH. The Degree project (Master’s Thesis project) can be performed abroad providing the student has an advisor at KTH and one at the receiving institution and that the work follows the KTH regulations for a Thesis project. Studies abroad require an agreement with the program director.

**Examensarbete**

The thesis project comprises 30 higher education credits of work and a major part of the course work, a minimum of 60 higher education credits, must have been completed before the project may commence. The project may be conducted individually or in collaboration with one other student and the topic of the project must provide an in-depth study within the field of the program. The thesis is graded on a scale from A to F. A-E are passing grades, A is the highest grade. The evaluation criteria, which are common to all of KTH, are the technical and scientific contents, the work process and the presentation of the project at the conclusion. **Examen**

Students who have successfully completed a two-year Master’s programme (120 ECTS) will be awarded a "Teknologie masterexamen", translated into English as "Degree of Master of Science (two years)". For the degree, the following is required:

- At least 90 higher education credits from the course list
- Pass Degree Project 30 higher education credits.
